# 74LVTH16543 Low Voltage 16-Bit Registered Transceiver with 3-STATE Outputs

#### **General Description**

The LVTH16543 16-bit transceiver contains two sets of Dtype latches for temporary storage of data flowing in either direction. Separate Latch Enable and Output Enable inputs are provided for each register to permit independent control of inputting and outputting in either direction of data flow. Each byte has separate control inputs, which can be shorted together for full 16-bit operation.

The LVTH16543 data inputs include bushold, eliminating the need for external pull-up resistors to hold unused inputs.

These transceivers are designed for low-voltage (3.3V)  $V_{CC}$  applications, but with the capability to provide a TTL interface to a 5V environment. The LVTH16543 is fabricated with an advanced BiCMOS technology to achieve high speed operation similar to 5V ABT while maintaining low power dissipation.

#### Features

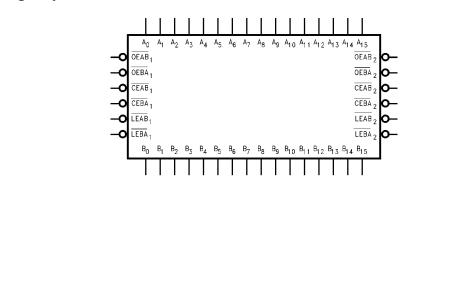

- $\blacksquare$  Input and output interface capability to systems at 5V  $\rm V_{CC}$
- Bushold data inputs eliminate the need for external pullup resistors to hold unused inputs
- Live insertion/extraction permitted
- Power Up/Down high impedance provides glitch-free bus loading
- Outputs source/sink -32 mA/+64 mA
- Functionally compatible with the 74 series 16543
- Latch-up performance exceeds 500 mA

#### **Ordering Code:**

Order Number	Package Number	Package Description
74LVTH16543MEA	MS56A	56-Lead Shrink Small Outline Package (SSOP), JEDEC MO-118, 0.300 Wide
74LVTH16543MTD	MTD56	56-Lead Thin Shrink Small Outline Package (TSSOP), JEDEC MO-153, 6.1mm Wide

Device also available in Tape and Reel. Specify by appending suffix letter "X" to the ordering code.

### **Functional Description**

The LVTH16543 contains two sets of D-type latches, with separate input and output controls for each. For data flow from A to B, for example, the A to B Enable (CEAB) input must be LOW in order to enter data from the A Port or take data from the B Port as indicated in the Data I/ O Control Table. With CEAB LOW, a low signal on (LEAB) input makes the A to B latches transparent; a subsequent LOWto-HIGH transition of the LEAB line puts the A latches in

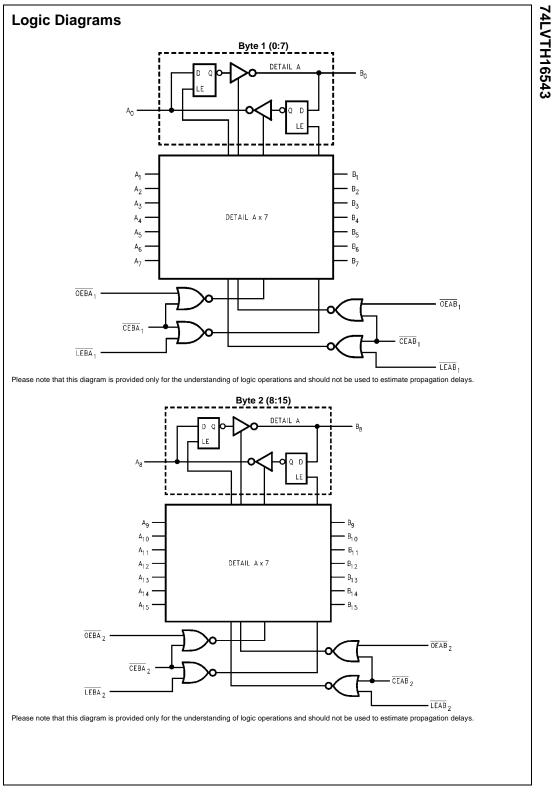

the storage mode and their outputs no longer change with the A inputs. With CEAB and OEAB both LOW, the B output buffers are active and reflect the data present on the output of the A latches. Control of data flow from B to A is similar, but using the CEBA, LEBA and OEBA. Each byte has separate control inputs, allowing the device to be used as two 8-bit transceivers or as one 16-bit transceiver.

#### Data I/O Control Table
