HEX BUS BUFFER
TC74VHC367 F / FN / FT NON - INVERTED, 3 - STATE OUTPUTS
TC74VHC368 F / FN / FT INVERTED, 3 - STATE OUTPUTS

(Note) The JEDEC SOP (FN) is not available in Japan.

The TC74VHC367 and 368 are advanced high speed CMOS HEX BUS BUFFERs fabricated with silicon gate C2MOS technology.

They achieve the high speed operation similar to equivalent Bipolar Schottky TTL while maintaining the CMOS low power dissipation.

They contain six buffers; four buffers are controlled by an enable input (\bar{G}_1), and the other two buffers are controlled by another enable input (\bar{G}_2). The outputs of each buffer group are enabled when \bar{G}_1 and/or \bar{G}_2 inputs are held low; if held high, these outputs are in a high impedance state.

The TC74VHC367 is a non-inverting output type, while the TC74VHC368 is an inverting output type.

An input protection circuit ensures that 0 to 7V can be applied to the input pins without regard to the supply voltage. This device can be used to interface 5V to 3V systems and two supply systems such as battery back up. This circuit prevents device destruction due to mismatched supply and input voltages.
