

# **Frequency Timing Generator for Transmeta Systems**

### **Recommended Application:**

Transmeta

### **Output Features:**

- 1CPU(2.5V or 3.3V selectable) up to 66.6MHz & overclocking of 66MHz.
- 6 PCI (3.3V) @ 33.3MHz (all are free running selectable).
- 1 REF (3.3V) at 14.318MHz.
- 1 48MHz (3.3V).
- 1 24 48MHz selectable output.

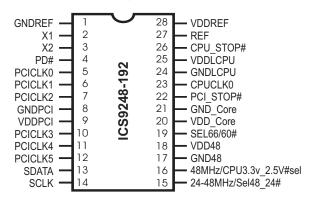

### Features:

- Supports Spread Spectrum modulation for CPU and PCI clocks, default -0.4 downspread.
- Efficient Power management scheme through stop clocks and power down modes.
- Uses external 14.318MHz crystal, no external load cap required for CL=18pF crystal.
- 28-pin TSSOP package, 4.40mm (173mil).

### **Skew Characteristics:**

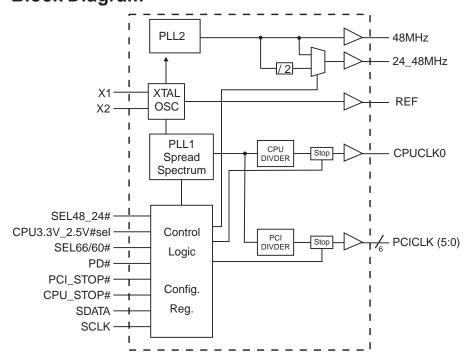

- CPU CPU <175ps
- PCI PCI < 500ps</li>
- CPU(early) PCI = 1.5ns 4ns.

## **Pin Configuration**

28-Pin TSSOP

# **Block Diagram**

# **Power Groups**

VDD\_Core, GND\_Core = PLL core VDDREF, GNDREF = REF, X1, X2 VDDPCI, GNDPCI = PCICLK (5:0) VDD48, GND48 = 48MHz (1:0)

# **Pin Descriptions**

| Pin number          | Pin name     | Type   | Description                                                                                                                                                                                     |
|---------------------|--------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1                   | GNDREF       | Power  | Ground for 14.318 MHz reference clock outputs                                                                                                                                                   |
| 2                   | X1           | Input  | 14.318 MHz crystal input                                                                                                                                                                        |
| 3                   | X2           | Output | 14.318 MHz crystal output                                                                                                                                                                       |
| 4                   | PD#          | Input  | Asynchronous active low input pin used to power down the device into a low power state. The internal clocks are disabled and the VCO and the crystal are stopped. The latency of the power down |
| 12, 11, 10, 7, 6, 5 | PCICLK (5:0) | Output | will not be greater than 3ms.  3.3V PCI clock outputs, free running selectable                                                                                                                  |
| 8                   | GNDPCI       | Power  | Ground for PCI clock outputs                                                                                                                                                                    |
| 9                   | VDDPCI       | Power  | 3.3V power for the PCI clock outputs                                                                                                                                                            |
| 9                   | Sel48_24#    |        | Selects 24MHz (0) or 48MHz (1) output                                                                                                                                                           |
| 15                  |              | Input  |                                                                                                                                                                                                 |
| 40                  | 24_48MHz     | Output | Selectable output either 24MHz or 48MHz                                                                                                                                                         |
| 13                  | SDATA        | I/O    | Data pin for I <sup>2</sup> C circuitry 5V tolerant                                                                                                                                             |
| 14                  | SCLK         | IN     | Clock pin of I <sup>2</sup> C circuitry 5V tolerant                                                                                                                                             |
|                     | CPU3.3-2.5#  | Input  | 3.3 (1) or 2.5 (0) VDD buffer strength selection, has pullup to VDD, nominal 30K resistor.                                                                                                      |
| 16                  | 48MHz        | Output | 3.3V 48 MHz clock output, fixed frequency clock typically used with USB devices                                                                                                                 |
| 17                  | GND48        | Power  | Ground for 48 MHz clocks                                                                                                                                                                        |
| 18                  | VDD48        | Power  | 3.3V power for 48/24 MHz clocks                                                                                                                                                                 |
| 19                  | SEL 66/60#   | Input  | Control for the frequency of clocks at the CPU & PCICLK output pins. "0" = 60 MHz. "1" = 66.6 MHz. The PCI clock is multiplexed to run at 33.3 MHz for both selected cases.                     |
| 20                  | VDD_Core     | Power  | Isolated 3.3V power for core                                                                                                                                                                    |
| 21                  | GND_Core     | Power  | Isolated ground for core                                                                                                                                                                        |
| 22                  | PCI_Stop#    | Input  | Synchronous active low input used to stop the PCICLK in active low state. It will not effect PCICLK_F or any other outputs.                                                                     |
| 23                  | CPUCLK0      | Output | CPU clock outputs selectable 2.5V or 3.3V.                                                                                                                                                      |
| 24                  | GNDLCPU      | Power  | Ground for CPU clock outputs                                                                                                                                                                    |
| 25                  | VDDLCPU      | Power  | 2.5V or 3.3V power for CPU clock outputs                                                                                                                                                        |
| 26                  | CPU_STOP#    | Input  | Asynchronous active low input pin used to stop the CPUCLK in active low state, all other clocks will continue to run. The CPUCLK will have a "Turnon" latency of at least 3 CPU clocks.         |
| 27                  | REF          | Output | 3.3V 14.318 MHz reference clock output                                                                                                                                                          |
| 28                  | VDDREF       | Power  | 3.3V power for 14.318 MHz reference clock outputs.                                                                                                                                              |

### **CPU Select Functions**

| SEL 66/60# | CPU (MHz) |
|------------|-----------|
| 0          | 60MHz     |
| 1          | 66.6MHz   |

### **Power Management**

### **Clock Enable Configuration**

| CPU_STOP# | PCI_STOP# | PWR_DWN# | CPUCLK     | PCICLK   | REF     | Crystal | VCOs    |
|-----------|-----------|----------|------------|----------|---------|---------|---------|
| X         | X         | 0        | Low        | Low      | Stopped | Off     | Off     |
| 0         | 0         | 1        | Low        | Low      | Running | Running | Running |
| 0         | 1         | 1        | Low        | 33.3 MHz | Running | Running | Running |
| 1         | 0         | 1        | 60/66.6MHz | Low      | Running | Running | Running |
| 1         | 1         | 1        | 60/66.6MHz | 33.3 MHz | Running | Running | Running |

Full clock cycle timing is guaranteed at all times after the system has initially powered up except where noted. During power up and power down operations using the PD# pin will not cause clocks of a short or longer pulse than that of the running clock. The first clock pulse coming out of a stopped clock condition may be slightly distorted due to clock network charging circuitry. Board routing and signal loading may have a large impact on the initial clock distortion also.

### ICS9248-192 Power Management Requirements

| SIGNAL     | SIGNAL STATE                      | Latency<br>No. of rising edges of free<br>running PCICLK |
|------------|-----------------------------------|----------------------------------------------------------|
| CPU STOP#  | 0 (Disabled)2                     | 1                                                        |
| CPU_ 510P# | 1 (Enabled)1                      | 1                                                        |
| PCI_STOP#  | 0 (Disabled) <sup>2</sup>         | 1                                                        |
|            | 1 (Enabled)1                      | 1                                                        |
| PD#        | 1 (Normal Operation) <sup>3</sup> | 3ms                                                      |
| FD#        | 0 (Power Down)4                   | 2max                                                     |

### Notes.

- 1. Clock on latency is defined from when the clock enable goes active to when the first valid clock comes out of the device.
- 2. Clock off latency is defined from when the clock enable goes inactive to when the last clock is driven low out of the device.
- 3. Power up latency is when PD# goes inactive (high) to when the first valid clocks are output by the device.
- 4. Power down has controlled clock counts applicable to CPUCLK, PCICLK only. The REF will be stopped independant of these.

# General I<sup>2</sup>C serial interface information

The information in this section assumes familiarity with  $I^2C$  programming. For more information, contact ICS for an  $I^2C$  programming application note.

### **How to Write:**

- Controller (host) sends a start bit.
- Controller (host) sends the write address D2 (H)
- ICS clock will *acknowledge*
- Controller (host) sends a dummy command code
- ICS clock will acknowledge
- Controller (host) sends a dummy byte count
- ICS clock will acknowledge
- Controller (host) starts sending first byte (Byte 0) through byte 6
- ICS clock will acknowledge each byte one at a time.
- Controller (host) sends a Stop bit

| How to             | Write:               |
|--------------------|----------------------|
| Controller (Host)  | ICS (Slave/Receiver) |
| Start Bit          |                      |
| Address            |                      |
| D2 <sub>(H)</sub>  |                      |
|                    | ACK                  |
| Dummy Command Code |                      |
|                    | ACK                  |
| Dummy Byte Count   |                      |
|                    | ACK                  |
| Byte 0             |                      |
|                    | ACK                  |
| Byte 1             | 40%                  |
| D. 4- 0            | ACK                  |
| Byte 2             | ACK                  |
| Byte 3             | ACK                  |
| Dyte 3             | ACK                  |
| Byte 4             | ,.on                 |
| 2,10 1             | ACK                  |
| Byte 5             | ,                    |
|                    | ACK                  |
| Byte 6             |                      |
|                    | ACK                  |
| Stop Bit           |                      |

### How to Read:

- Controller (host) will send start bit.
- $\bullet$  Controller (host) sends the read address D3  $_{ ext{(H)}}$
- ICS clock will acknowledge
- ICS clock will send the byte count
- Controller (host) acknowledges
- ICS clock sends first byte (Byte 0) through byte 6
- · Controller (host) will need to acknowledge each byte
- Controller (host) will send a stop bit

| How to            | Read:                |
|-------------------|----------------------|
| Controller (Host) | ICS (Slave/Receiver) |
| Start Bit         |                      |

### **Notes:**

- The ICS clock generator is a slave/receiver, I<sup>2</sup>C component. It can read back the data stored in the latches for verification. Read-Back will support Intel PIIX4 "Block-Read" protocol.
- 2. The data transfer rate supported by this clock generator is 100K bits/sec or less (standard mode)
- 3. The input is operating at 3.3V logic levels.
- 4. The data byte format is 8 bit bytes.
- 5. To simplify the clock generator I<sup>2</sup>C interface, the protocol is set to use only "**Block-Writes**" from the controller. The bytes must be accessed in sequential order from lowest to highest byte with the ability to stop after any complete byte has been transferred. The Command code and Byte count shown above must be sent, but the data is ignored for those two bytes. The data is loaded until a Stop sequence is issued.
- 6. At power-on, all registers are set to a default condition, as shown.

# Serial Configuration Command Bitmap Byte0: Functionality and Frequency Select Register (default = 0)

### **CPU\_STOP#Timing Diagram**

CPUSTOP# is an asychronous input to the clock synthesizer. It is used to turn off the CPUCLKs for low power operation. CPU\_STOP# is synchronized by the ICS9248-192. The minimum that the CPUCLK is enabled (CPU\_STOP# high pulse) is 100 CPUCLKs. All other clocks will continue to run while the CPUCLKs are disabled. The CPUCLKs will always be stopped in a low state and start in such a manner that guarantees the high pulse width is a full pulse. CPUCLK on latency is less than 4 CPUCLKs and CPUCLK off latency is less than 4 CPUCLKs.

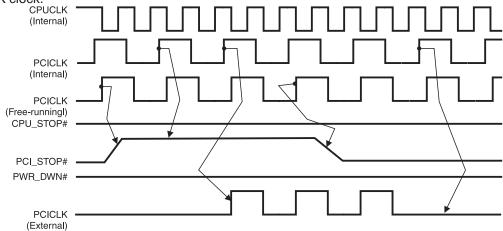

#### Notes:

- 1. All timing is referenced to the internal CPUCLK.
- CPU\_STOP# is an asynchronous input and metastable conditions may exist. This signal is synchronized to the CPUCLKs inside the ICS9248-192.
- 3. All other clocks continue to run undisturbed.
- 4. PD# and PCI\_STOP# are shown in a high (true) state.

# **PCI\_STOP#Timing Diagram**

PCI\_STOP# is an asynchronous input to the ICS9248-192. It is used to turn off the PCICLK clocks for low power operation. PCI\_STOP# is synchronized by the ICS9248-192 internally. The minimum that the PCICLK clocks are enabled (PCI\_STOP# high pulse) is at least 10 PCICLK clocks. PCICLK clocks are stopped in a low state and started with a full high pulse width guaranteed. PCICLK clock on latency cycles are only one rising PCICLK clock off latency is one PCICLK clock.

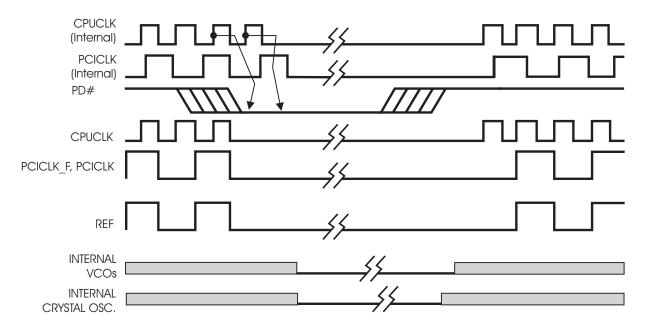

### Notes:

- 1. All timing is referenced to the Internal CPUCLK (defined as inside the ICS9248-192 device.)
- PCI\_STOP# is an asynchronous input, and metastable conditions may exist. This signal is required to be synchronized inside the ICS9248-192.
- 3. All other clocks continue to run undisturbed.
- 4. PD# and CPU\_STOP# are shown in a high (true) state.

## **PD#Timing Diagram**

The power down selection is used to put the part into a very low power state without turning off the power to the part. PD# is an asynchronous active low input. This signal is synchronized internally by the **ICS9248-192** prior to its control action of powering down the clock synthesizer. Internal clocks will not be running after the device is put in power down state. When PD# is active (low) all clocks are driven to a low state and held prior to turning off the VCOs and the crystal oscillator. The power on latency is guaranteed to be less than 3ms. The power down latency is less than three CPUCLK cycles. PCI\_STOP# and CPU\_STOP# are don't care signals during the power down operations.

### Notes:

- 1. All timing is referenced to the Internal CPUCLK (defined as inside the ICS9248 device).
- 2. PD# is an asynchronous input and metastable conditions may exist. This signal is synchronized inside the ICS9248.
- 3. The shaded sections on the VCO and the Crystal signals indicate an active clock is being generated.

## **Absolute Maximum Ratings**

Supply Voltage ..... 5.5 V

Logic Inputs . . . . . . . . . . . . . GND -0.5~V to  $~V_{DD}~+0.5~V$ 

Ambient Operating Temperature . . . . . . . . 0°C to +70°C

Stresses above those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These ratings are stress specifications only and functional operation of the device at these or any other conditions above those listed in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

### **Electrical Characteristics - Input/Supply/Common Output Parameters**

 $T_A = 0 - 70$ °C; Supply Voltage  $V_{DDL} = 2.5$ V,  $V_{DD} = 3.3$  V +/-5% (unless otherwise stated)
