DESCRIPTION

The TL431 is a three-terminal adjustable regulator series with a guaranteed thermal stability over applicable temperature ranges. The output voltage may be set to any value between V_{ref} (approximately 2.5 volts) and 36 volts with two external resistors. These devices have a typical dynamic output impedance of 0.2Ω . Active output circuitry provides a very sharp turn-on characteristic, making these devices excellent replacement for zener diodes in many applications.

The TL431 is characterized for operation from 0°C to $+70^\circ\text{C}$.

Note: 1. The deviation parameters $V_{REF(dev)}$ and $I_{REF(dev)}$ are defined as the differences between the maximum and minimum values obtained over the rated temperature range.

$$V_{REF(dev)} = V_{REF(max)} - V_{REF(min)}$$

The equivalent full-range temperature coefficient of the reference input voltage, αV_{REF} is defined as:

$$\alpha V_{REF} \left(\frac{ppm}{^{\circ}C} \right) = \frac{\left(\frac{V_{REF(dev)}}{V_{REF@^{\circ}C}} \right) \times 10^6}{\Delta T_a}$$

where ΔT_a is the rated operating free-air temperature range of the device.

αV_{REF} can be positive or negative depending on whether minimum V_{REF} or maximum V_{REF} respectively, occurs at the lower temperature.

2. The dynamic impedance is defined as:

$$|Z_{KA}| = \frac{\Delta V_{KA}}{\Delta I_K}$$

When the device is operated with two external resistors (see Figure 2), the total dynamic impedance of the circuit is given by:

$$|Z'| = \frac{\Delta V}{\Delta I} = |Z_{KA}| \left(1 + \frac{R1}{R2} \right)$$
