Function Description

- Power sw: push switch to power on or power off.
- When power on: push the switch, then it will generate a "beep" sound for 0.125 sec.
 - a. First displays all the segments on for 2 sec.
 - b. After a. as described above, then shows the last time measured temperature for 2 sec.
 - c. After b., shows L °C or °F for 0.75 sec.
 - d. After c., displays the measured temperature, then °C or °F mark will flash at a speed of 1Hz.
 - e. If the temperature is < 32°C (or 90°F), the display shows L °C (or °F).
 - f. If the temperature $\geq 42^{\circ}\text{C}$ (or 108°F) the display shows H °C (or °F).
 - g. The display always shows the higher temperature during the temperature measurement.
 - h. If the measured temperature does not change for more than 16 sec., the measurement is over and the °C (or °F) mark flash stops.
 - i. When measurement is over, if the temperature $> 37.5^{\circ}\text{C}$ (or 99.5°F) the buzzer alarms "beep-beep-beep-beep-beep-beep-" for 4 sec, as follows:

BI BI BI
 0.125S 0.125S 0.125S 0.125S 0.125S 0.125S 0.375S
 - j. It will automatically turn the power off when measurement is over for 8 min 40 sec.
 - k. When measurement is over, but if the temperature rises within 8 min 40 sec, the °C (or °F) mark will flash again (repeat from step 2-d), and starts to count 8 min 40 sec again.
 - l. When beep sound is on for 4 sec, the temperature is not measured.
- When power off: the standby current $\leq 1\mu\text{A}$.
- The frequency of the buzzer is 5.3kHz
- Bonding option °C or °F
- Measurement to 0.1 degree in either °C or °F
- Sensor use 503ET
- Reference resistor is the value (sensor in 37.0°C)
- When battery voltage is low, the battery mark ∇ flashes at the speed of 1Hz and the measurement may not be accurate. The low voltage detect: $1.35\text{V} \pm 0.05\text{V}$.
- During the process of mass production, in order to adjust the reference resistance (RF), let test 2 be floating, the measured temperature will be the actual temperature of the measured environment. It can be up or down, not always the higher one.

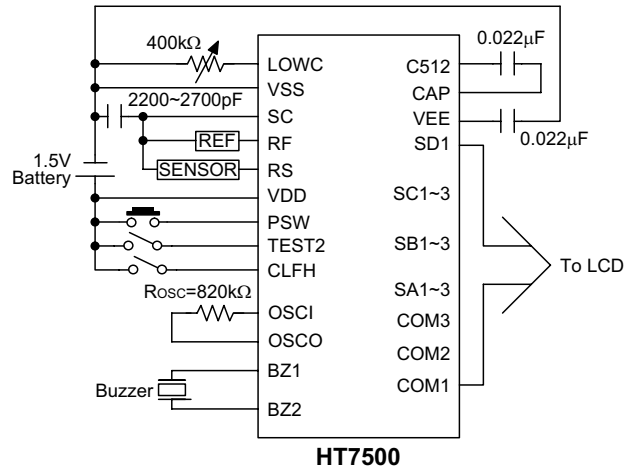

if the temperature $\leq 37.5^{\circ}\text{C}$ (or 99.5°F), the buzzer alarms "beep-beep-beep-beep-" for 4 sec, as follows:

Application Circuits

Note: Substrate connect to VDD

VEE, CAP, and C512 are externally connected to capacitors for stabilizing V_{EE} ($=-1.5V$).

BZ1 and BZ2 are connected to an external buzzer to generate sounds.

LOWC is connected to an external resistor for adjusting the detector level of a low voltage detector. Open the pin when not in use.

OSCI, OSCO are connected to an external resistor, and form an RC oscillator with a built-in capacitor for SYSTEM clock ($=32kHz$)

RS, RF, SC constitute an alternating RC oscillator, which allows one oscillator, namely RS or RF, active at a time.

REF (reference resistor) is a resistor value equal to 503ET, sensor is value in 37.0 °C or 98.6 °F.

SENSOR is a 503ET thermistor.
