

## FEATURES

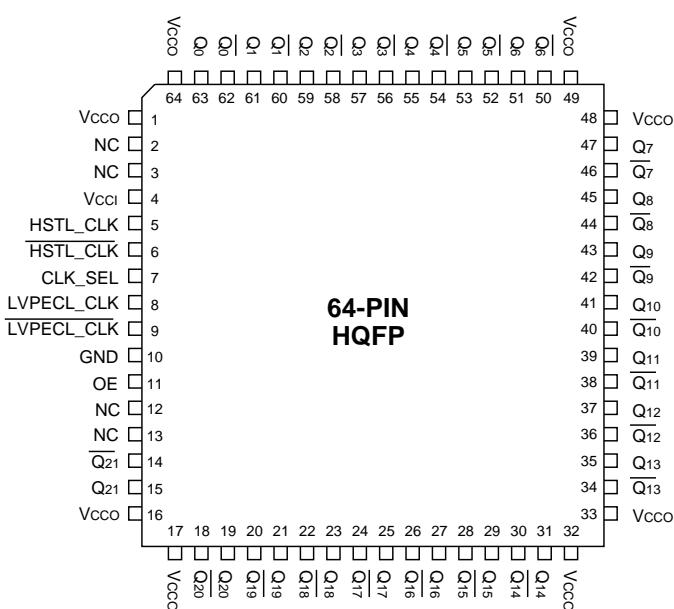

- 3.3V core supply, 1.8V output supply for reduced power
- LVPECL and HSTL inputs
- 22 differential HSTL (low-voltage swing) output pairs
- HSTL outputs drive 50Ω to ground with no offset voltage
- Low part-to-part skew (200ps max.)
- Low pin-to-pin skew (50ps max.)
- Available in a 64-Pin EPAD HQFP

## DESCRIPTION

The SY89824L is a High Performance Bus Clock Driver with 22 differential HSTL (High Speed Transceiver Logic) output pairs. The part is designed for use in low voltage (3.3V/1.8V) applications which require a large number of outputs to drive precisely aligned, ultra low skew signals to their destination. The input is multiplexed from either HSTL or LVPECL (Low Voltage Positive Emitter Coupled Logic) by the CLK\_SEL pin. The Output Enable (OE) is synchronous so that the outputs will only be enabled/disabled when they are already in the LOW state. This avoids any chance of generating a runt clock pulse when the device is enabled/disabled as can happen with an asynchronous control.

The SY89824L features low pin-to-pin skew (50ps max.) and low part-to-part skew (200ps max.)—performance previously unachievable in a standard product having such a high number of outputs. The SY89824L is available in a single space saving package, enabling a lower overall cost solution.

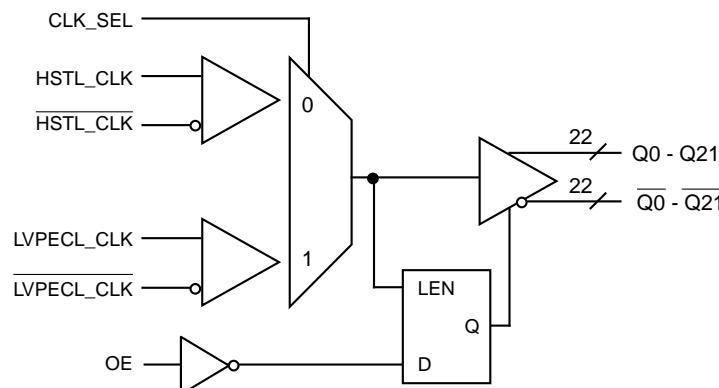

## PIN CONFIGURATION

## PIN NAMES

Pin	Function
HSTL_CLK, /HSTL_CLK	Differential HSTL Inputs
LVPECL_CLK, /LVPECL_CLK	Differential LVPECL Inputs
CLK_SEL	Input CLK Select (LVTTL)
OE	Output Enable (LVTTL)
Q0-Q21, /Q0-/Q21	Differential HSTL Outputs
GND	Ground
VCCI	Vcc Core
Vcco	Vcc Output

**NOTES:**

- Outputs loaded with 50Ω to ground. Airflow ≥ 300 LFPM.
- Differential propagation delay is defined as the delay from the crossing point of the differential input signals to the crossing point of the differential output signals.
- The within-device skew is defined as the worst case difference between any two similar delay paths within a single device operating at the same voltage and temperature.
- The part-to-part skew is defined as the absolute worst case difference between any two delay paths on any two devices operating at the same voltage and temperature.
- The V<sub>PP</sub> (min.) is defined as the minimum input differential voltage which will cause no increase in the propagation delay.
- V<sub>CMR</sub> is defined as the range within which the VIH level may vary, with the device still meeting the propagation delay specification. The numbers in the table are referenced to V<sub>CC1</sub>. The VIL level must be such that the peak-to-peak voltage is less than 1.0V and greater than or equal to V<sub>PP</sub> (min.). The lower end of the CMR range varies 1:1 with V<sub>CC1</sub>. The V<sub>CMR</sub> (min.) will be fixed at 3.3V – |V<sub>CMR</sub> (min.)|.
- OE set-up time is defined with respect to the rising edge of the clock. OE HIGH to LOW transition ensures outputs remain disabled during the next clock cycle. OE LOW to HIGH transition enables normal operation of the next input clock.
