

NDH8303N Dual N-Channel Enhancement Mode Field Effect Transistor

General Description

SuperSOT™-8 N-Channel enhancement mode power field effect transistors are produced using Fairchild's proprietary, high cell density, DMOS technology. This very high density process is especially tailored to minimize on-state resistance. These devices are particularly suited for low voltage applications such as notebook computer power management, and other battery powered circuits where fast switching, and low in-line power loss are needed in a very small outline surface mount package.

Features

- 3.8 A, 20 V. $R_{DS(ON)} = 0.035 \Omega$ @ $V_{GS} = 4.5$ V
 $R_{DS(ON)} = 0.045 \Omega$ @ $V_{GS} = 2.7$ V.
- Proprietary SuperSOT™-8 package design using copper lead frame for superior thermal and electrical capabilities.
- High density cell design for extremely low $R_{DS(ON)}$.
- Exceptional on-resistance and maximum DC current capability.

Absolute Maximum Ratings $T_A = 25^\circ\text{C}$ unless otherwise noted

Notes:

1. R_{JJA} is the sum of the junction-to-case and case-to-ambient thermal resistance where the case thermal reference is defined as the solder mounting surface of the drain pins. R_{JJC} is guaranteed by design while R_{JCA} is determined by the user's board design.

$$P_D(t) = \frac{T_J - T_A}{R_{\text{JJA}}(t)} = \frac{T_J - T_A}{R_{\text{JJC}} + R_{\text{JCA}}(t)} = I_D^2(t) \times R_{DS(\text{ON})} @ T_J$$

Typical R_{JJA} for single device operation using the board layout shown below on 4.5" x 5" FR-4 PCB in a still air environment:

Scale 1 : 1 on letter size paper.

2. Pulse Test: Pulse Width $\leq 300\mu\text{s}$, Duty Cycle $\leq 2.0\%$.
