

# +3.3V, 2.7Gbps Dual 2 × 2 Crosspoint Switch

**MAX3840**

## General Description

The MAX3840 is a dual 2 × 2 asynchronous crosspoint switch for SDH/SONET DWDM and other high-speed data switching applications where serial data stream loop-through and protection channel switching are required. It is ideal for OC-48 systems with forward error correction. A high-bandwidth, fully differential signal path minimizes jitter accumulation, crosstalk, and signal skew. Each 2 × 2 crosspoint switch can fan out and/or multiplex up to 2.7Gbps data and 2.7GHz clock signals. All inputs and outputs are current mode logic (CML) compatible and easily adaptable to interface with an AC-coupled LVPECL signal. When not used, each CML output stage can be powered down with an enable control to conserve power. The typical power consumption is 460mW with all outputs enabled.

The MAX3840 is compatible with the MAX3876 2.5Gbps clock and data recovery (CDR) circuit.

The MAX3840 is available in a 32-pin exposed-pad QFN package (5mm × 5mm footprint) and operates from a +3.3V supply over a temperature range of -40°C to +85°C.

## Applications

- SDH/SONET and DWDM Transport Systems
- Add-Drop Multiplexers
- ATM Switch Cores
- WDM Cross-Connects
- High-Speed Backplanes

## Features

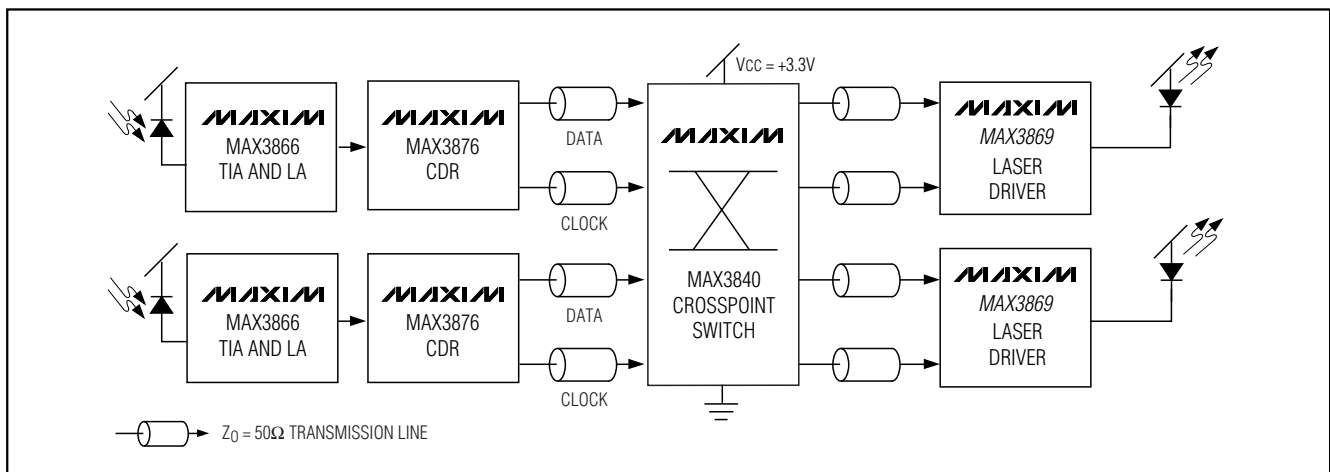

- ◆ Single +3.3V Supply
- ◆ 460mW Power Consumption
- ◆ 2ps<sub>RMS</sub> Random Jitter
- ◆ 7ps<sub>P-P</sub> Deterministic Jitter
- ◆ Power-Down Feature for Deselected Outputs
- ◆ CML Inputs/Outputs
- ◆ 6ps Channel-to-Channel Skew
- ◆ 100ps Output Edge Speed
- ◆ 5mm × 5mm 32 QFN Package

Figure 2. CML Output Levels

## Detailed Description

The block diagram in Figure 1 shows the MAX3840 architecture. The SELA\_ and SELB\_ pins control the routing of the signals through the crosspoint switch. Each output of the crosspoint switch drives a CML output driver. Each of the outputs, DOA\_ and DOB\_, is enabled or disabled by the respective ENA\_ and ENB\_ pins.

## CML Inputs and Outputs

CML is used to simplify high-speed interfacing. On-chip input and output terminations minimize the number of external components required while improving signal integrity. The CML output signal swing is small, resulting in lower power consumption. The internal 50Ω input and output terminations minimize reflections and eliminate the need for external terminations.

## Applications Information

### Interfacing PECL Inputs and Outputs to the MAX3840

For information on interfacing with CML, refer to Maxim Application Note HFAN-1, *Interfacing Between CML, PECL, and LVDS*.

## Layout Techniques

For best performance, use good high-frequency layout techniques, filter VCC supplies, and keep ground connections short. Use multiple vias where possible. Also, use controlled-impedance transmission lines to interface with the MAX3840 data inputs and outputs.

## Interface Models

Figure 3 shows the interface model for the CML inputs, and Figure 4 shows the model for CML outputs.
