LC7574NE, 7574NW

1/2 Duty VFD Driver for Frequency Display

CCB

Overview

The LC7574NE and LC7574NW are 1/2 duty VFD drivers that can be used for electronic tuning frequency display and other applications under the control of a controller. These products can directly drive VFDs with up to 74 segments.

Features

• 74 segment outputs
• Noise reduction circuits are built into the output drivers.
• Serial data input supports CCB* format communications with the system controller.
• Switching between digital and analog dimmers under serial data control
• High generality since display data is displayed without the intervention of a decoder
• All segments can be turned off with the $\overline{\text{BLK}}$ pin

Specifications

Absolute Maximum Ratings at Ta = 25°C, V_{SS} = 0 V

Parameter	Symbol	Conditions	Ratings	Unit
Maximum supply voltage	V_{DD} max	V_{DD}	−0.3 to +6.5	V
	V_{FL} max	V_{FL}	−0.3 to +21.0	V
Input voltage	$V_{IN}1$	DI, CL, CE, $\overline{BLK}$, DIM	−0.3 to +6.5	V
	$V_{IN}2$	OSC	−0.3 to V_{DD} + 0.3	V
Output voltage	$V_{OUT}1$	S1 to S37, G1, G2	−0.3 to V_{FL} + 0.3	V
	$V_{OUT}2$	OSC	−0.3 to V_{DD} + 0.3	V
Output current	$I_{OUT}1$	S1 to S37	5	mA
	$I_{OUT}2$	G1, G2	67	mA
Allowable power dissipation	Pd max	Ta = 85°C (LC7574NE)	250	mW
		Ta = 85°C (LC7574NW)	150	mW
Operating temperature	Topr		−40 to +85	°C
Storage temperature	Tstg		−50 to +125	°C

Allowable Operating Ranges at Ta = –40 to +85°C, V_{DD} = 4.5 to 5.5 V, V_{SS} = 0 V

Parameter	Symbol	Conditions	min	typ	max	Unit
Supply voltage	V_{DD}	V_{DD}	4.5	5.0	5.5	V
	V_{FL}	V_{FL}	8	12	18	V
Input high level voltage	V_{IH}	DI, CL, CE, $\overline{BLK}$	0.8 V_{DD}		5.5	V
Input low level voltage	V_{IL}	DI, CL, CE, $\overline{BLK}$	0		0.2 V_{DD}	V
Guaranteed oscillator range	f_{OSC}	OSC	0.4	1.6	3.0	MHz
Recommended external resistance	R_{OSC}	OSC		12		kΩ
Recommended external capacitance	C_{OSC}	OSC		50		pF
Low level clock pulse width	$t_{\emptyset L}$	CL: Figure 1	0.5			µs

Pin Functions

Pin No.	Pin	I/O	Function		Handling when unused
4	V_{FL}	—	Driver block power supply. A voltage of between 8.0 and 18.0 V must be supplied.		—
1	V_{DD}	—	Logic block power supply. A voltage of between 4.5 and 5.5 V must be supplied.		—
46	V_{SS}	—	Ground. Must be connected to the system ground.		—
48	OSC	I/O	Oscillator connection. An oscillator circuit is formed by connecting an external resistor and capacitor to this pin.		V_{DD}
47	$\overline{BLK}$	I	Display off control input $\overline{BLK}$ = low (V_{SS}): Display off (G1 and G2 = low) BLK = high (V_{DD}): Display on Note that serial data can be transferred while the display is turned off.		GND
44	CL	I	Serial data transfer inputs. These pins must be connected to the system controller.	CL: synchronization clock DI: transfer data CE: chip enable	GND
43	DI				
42	CE				
45	DIM	I	When the analog dimmer is selected, the analog voltage applied to this pin controls the duty of the G1 and G2 digit output pins. Since a 6-bit A/D converter is applied to this analog voltage and that result is input to a decoder that provides a built-in dimmer curve, the relationship between the analog voltage and the duty can be specified as a mask program. Note that $63/96 \cdot V_{DD}$ is the full-scale level for the 6-bit A/D converter.		GND
2, 3	G1, G2	O	Digit outputs. The frame frequency f_O is $(f_{OSC}/4096)$ Hz		Open
41 to 5	S1 to S37	O	Segment outputs for displaying the display data transferred by serial data input.		Open

Serial Data Transfer Format

1. When CL is stopped at the low level

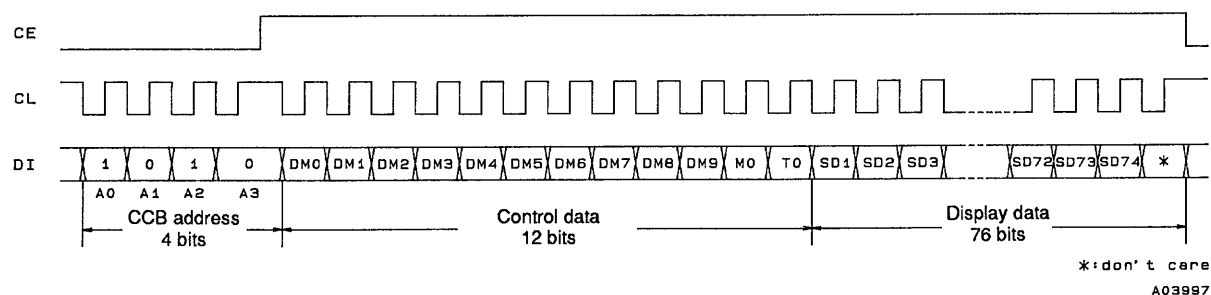

2. When CL is stopped at the high level

Figure 2

CCB address: Transfer 1010_B, as shown in Figure 2.

M0: Digital/analog dimmer selection data

M0 = 0 ....Digital dimmer

M0 = 1 ....Analog dimmer

DM0 to DM9: Dimmer data

This data controls the duty of the G1 and G2 digit output pins when the digital dimmer is selected. This data consists of 10 bits, of which DM0 is the LSB. Note that display intensity can be adjusted by controlling the duty of the G1 and G2 digit output pins. (The DM0 to DM9 dimmer data is ignored when the analog dimmer is selected.)

SD1 to SD74: Display data

SD1 to SD37..........................Display data for the G1 digit output pin

SD38 to SD74.........................Display data for the G2 digit output pin
SDn (n = 1 to 74) = 1..............Display on

SDn (n = 1 to 74) = 0..............Display off

T0: Test data

The T0 bit must be set to 0.

Correspondence between Display Data (SD1 to SD74) and Segment Output Pins

Segment output pin	G1	G2	Segment output pin	G1	G2
S1	SD1	SD38	S20	SD20	SD57
S2	SD2	SD39	S21	SD21	SD58
S3	SD3	SD40	S22	SD22	SD59
S4	SD4	SD41	S23	SD23	SD60
S5	SD5	SD42	S24	SD24	SD61
S6	SD6	SD43	S25	SD25	SD62
S7	SD7	SD44	S26	SD26	SD63
S8	SD8	SD45	S27	SD27	SD64
S9	SD9	SD46	S28	SD28	SD65
S10	SD10	SD47	S29	SD29	SD66
S11	SD11	SD48	S30	SD30	SD67
S12	SD12	SD49	S31	SD31	SD68
S13	SD13	SD50	S32	SD32	SD69
S14	SD14	SD51	S33	SD33	SD70
S15	SD15	SD52	S34	SD34	SD71
S16	SD16	SD53	S35	SD35	SD72
S17	SD17	SD54	S36	SD36	SD73
S18	SD18	SD55	S37	SD37	SD74
S19	SD19	SD56			

Example: Segment output pin S11 is controlled as follows:

Display data		Segment output pin S11 state
SD11	SD48	
0	0	The segments corresponding to both the G1 and G2 digit output pins are off.
0	1	The segment corresponding to the G2 digit output pin is on.
1	0	The segment corresponding to the G1 digit output pin is on.
1	1	The segments corresponding to both the G1 and G2 digit output pins are on.

$\overline{\text{BLK}}$ and the Display Control

Since the LSI internal data (SD1 to SD74 and the control data) is undefined when power is first applied, the display is off (G1 and G2 = low) by setting the $\overline{\text{BLK}}$ pin low at the same time as power is applied. Then, meaningless display at power on can be prevented by transferring all 92 bits of serial data from the controller while the display is off and setting $\overline{\text{BLK}}$ pin high after the transfer completes. (See Figure 3.)

Power Supply Sequence

The following sequences must be observed when power is turned on and off. (See Figure 3)
• Power on: Logic block power supply (V_{DD}) on → Driver block power supply (V_{FL}) on
• Power off: Driver block power supply (V_{FL}) off → Logic block power supply (V_{DD}) off

$t1 > 0$
$t2 > 0$
$t3 > 0 \quad (t2 > t3)$
$t_C \cdots \cdots 10\mu s \text{ min}$

Output Waveforms (S1 to S37)
Relation between Segment and Digit Outputs

A03999
Figure 4

Descriptions

1. Consider the examples shown in Figure 4, where data is set up so that the segment outputs S1 to S37 output a low level on the G1 digit output timing and a high level on the G2 digit output timing. (Here, the G2 side being lighted)

2. The digit output G1 and G2 waveforms in Example 1 are output when the 10 bits of dimmer data (DM0 to DM9) are set to $3FE_H$. The relation between t1 and the oscillator frequency f_{OSC} is:

   $t1 = 2/f_{OSC}$.

   For example, if f_{OSC} = 1.6 [MHz], then

   t1 = 2/1.6 [MHz] = 1.25 [μs].

   Note that t1 and t2 are the same period in Example 1.

3. The digit output G1 and G2 waveforms in Example 2 are those when the dimmer data (DM0 to DM9) are set to a smaller value. Although the time t1, which is from the point where digit output falls to segment output changes, does not change, the time t2, which is from the point where segment output changes to the time the digit output rises, becomes longer. When the dimmer data (DM0 to DM9) are set to $0FF_H$ and f_{OSC} is 1.6 [MHz], then the frame frequency f_O is:

   $$f_O = 1/(t3 \times 2)$$
 $$= f_{OSC}/4096$$
   $$= 391 \text{ [Hz]},$$
   and,
   $$t3 = 1.28 \text{ [ms]}.$$

   Therefore,

   $$t2 = \frac{(1.28 \text{ [ms]} - 1.25 \text{ [μs]} \times 2) \times (3FF_H - 0FF_H)}{1023} = 0.96 \text{ [ms]}.$$

4. When the dimmer data (DM0 to DM9) are set to an even smaller value, the time t2, which is from the point where segment output changes to the time the digit output rises, becomes even longer, as in Example 3. Note that t1 does not change here, either.

Usage Notes

1. Notes on the segment and digit waveforms

Segment waveform

Digit waveform 1

Digit waveform 2

A00005
Figure 5

The segment waveform is distorted by the VFD panel used and the wiring, and furthermore, in the case of being used with essentially no dimming as in the digit waveform 1, as shown in Figure 5, the VFD panel glow dimly. By carefully considering the segment waveform, it can be seen that this problem can be resolved by applying an adequate amount of dimming, as shown in Digit waveform 2. When f_{OSC} is 1.6 [MHz], we recommend using 10 bits of dimmer data in the range 000_H to $3E0_H$.
