

Micropower, Latching Voltage Monitors in SOT23-5

MAX834/MAX835

General Description

The MAX834/MAX835 micropower voltage monitors contain a 1.204V precision bandgap reference, comparator, and latched output in a 5-pin SOT23 package. Using the latched output prevents deep discharge of batteries. The MAX834 has an open-drain, N-channel output driver, while the MAX835 has a push/pull output driver. Two external resistors set the trip-threshold voltage.

The MAX834/MAX835 feature a level-sensitive latch, eliminating the need to add hysteresis to prevent oscillations in battery-load-disconnect applications.

Features

- ◆ Prevents Deep Discharge of Batteries
- ◆ Precision $\pm 1.25\%$ Voltage Threshold
- ◆ Latched Output (once low, stays low until cleared)
- ◆ SOT23-5 Package
- ◆ Low Cost
- ◆ Wide Operating Voltage Range, +2.5V to +11V
- ◆ $< 2\mu\text{A}$ Typical Supply Current
- ◆ Open-Drain Output (MAX834)
Push/Pull Output (MAX835)

Applications

Precision Battery Monitor
Load Switching
Battery-Powered Systems
Threshold Detectors

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Pin Description

PIN	NAME	FUNCTION
1	CLEAR	Clear Input resets the latched output. With $V_{IN} > V_{TH}$, pulse CLEAR high for a minimum of $1\mu s$ to reset the output latch. Connect to V_{CC} to make the latch transparent.
2	GND	System Ground
3	V_{CC}	System Supply Input
4	IN	Noninverting Input to the Comparator. The inverting input connects to the internal $1.204V$ bandgap reference.
5	$\overline{OUT}$	Open-Drain (MAX834) or Push/Pull (MAX835) Latched Output. $\overline{OUT}$ is active low.

Detailed Description

The MAX834/MAX835 micropower voltage monitors contain a 1.204V precision bandgap reference and a comparator with an output latch (Figure 1). The difference between the two parts is the structure of the comparator output driver. The MAX834 has an open-drain, N-channel output driver that can be pulled up to a voltage higher than V_{CC} , but less than 11V. The MAX835's output is push/pull and can both source and sink current.

Programming the Trip Voltage (V_{TRIP})

Two external resistors set the trip voltage, V_{TRIP} (Figure 2). V_{TRIP} is the point at which the falling monitored voltage (typically V_{CC}) causes $\overline{OUT}$ to go low. IN's high input impedance allows the use of large-value resistors without compromising trip voltage accuracy. To minimize current consumption, choose a value for R_2 between 500k Ω and 1M Ω , then calculate R_1 as follows:

$$R_1 = R_2 [(V_{TRIP} / V_{TH}) - 1]$$

where V_{TRIP} is the desired trip voltage and V_{TH} is the threshold voltage (1.204V). The voltage at IN must be at least 1V less than V_{CC} .

Latched-Output Operation

The MAX834/MAX835 feature a level-sensitive latch input (CLEAR), designed to eliminate the need for hysteresis in battery undervoltage-detection applications. When the monitored voltage (V_{MON}) is above the programmed trip voltage (V_{TRIP}) (as when the system battery is recharged or a fresh battery is installed), pulse CLEAR low-high-low for at least 1 μ s to reset the output latch ($\overline{OUT}$ goes high). When V_{MON} falls below V_{TRIP} , $\overline{OUT}$ goes low and remains low (even if V_{MON} rises above V_{TRIP}), until CLEAR is pulsed high again with $V_{MON} > V_{TRIP}$. Figure 3 shows the timing relationship between V_{MON} , $\overline{OUT}$, and CLEAR.

Figure 4. Monitoring Voltages Other than VCC

Figure 5. Load-Disconnect Switch

Monitoring Voltages Other than VCC

The typical operating circuit for the MAX834/MAX835 monitors VCC. Voltages other than VCC can easily be monitored, as shown in Figure 4. Calculate V_{TRIP} as in the section *Programming the Trip Voltage*. When monitoring voltages other than VCC, ensure that the maximum value for V_{MON} is not exceeded:

$$V_{MON(MAX)} = (V_{CC} - 1)(R1 + R2) / R2$$

Load-Disconnect Switch

The circuit in Figure 5 is designed to prevent a lead-acid battery or a secondary battery such as an NiCd, from sustaining damage through deep discharge. As the battery reaches critical undervoltage, OUT switches low. Q1 and Q2 turn off, disconnecting the battery from the load. The MAX835's latched output prevents Q1 and Q2 from turning on again as the battery voltage relaxes to its open-circuit voltage when the load disconnects. CLEAR can be connected to a pushbutton switch, an RC network, or a logic gate to reset the latch when the battery is recharged or replaced.
