

## Description

The MK2754 is MicroClock's lowest cost, low jitter, high performance VCXO and PLL clock synthesizer designed to replace expensive 54 MHz VCXOs. The on-chip Voltage Controlled Crystal Oscillator accepts a 0 to 3V input voltage to vary the output clocks by  $\pm 100$  ppm. Using MicroClock's patented VCXO and analog Phase-Locked Loop (PLL) techniques, the device uses an inexpensive external 13.5 MHz pullable crystal input to produce a 54 MHz output clock.

MicroClock manufactures the largest variety of Set-Top Box and multimedia clock synthesizers for all applications. If more clock outputs are needed, see the MK2731 or MK277x family of parts. Consult MicroClock to eliminate VCXOs, crystals and oscillators from your board.

1. Stresses beyond those listed under Absolute Maximum Ratings could cause permanent damage to the device. Prolonged exposure to levels above the operating limits but below the Absolute Maximums may affect device reliability.
  2. With a MicroClock approved pullable crystal.

## External Components

The MK2754 requires a minimum number of external components for proper operation. A decoupling capacitor of 0.1µF should be connected between VDD and GND on pins 2 and 4, as close to the MK2754 as possible. A series termination resistor of 33 Ω may be used for the clock output. The input crystal must be connected as close to the chip as possible. The input crystal should be a parallel mode, pullable, AT cut, 13.5MHz, with 14pF load capacitance. Consult MicroClock for recommended suppliers. **IMPORTANT** - read application note MAN05 before laying out the PCB.
