Dual 20 W BTL power amplifier

■ Overview

The AN7190NK and the AN7190NZ are audio power ICs developed for the sound output of car audio (dual 20 W). It is incorporating various protective circuits to protect the IC from destruction by GND-open, short circuit to GND and power supply surge which are the important subject of power IC protection, so the IC will largely contribute to a high reliability design of equipment. Also, it is incorporating a perfect muting circuit which is free from shock noise, so that a shock noise design under the set transient condition can be made easily using together with its standby function.

■ Usage Notes

1. Always attach an outside heat sink when using the chip. Note that, the outside heat sink must be fastened onto a chassis for use.
2. Connect the cooling fin to GND potential.
3. Avoid short circuit to V_{CC} and short circuit to GND, and load short-circuit.
4. The temperature protection circuit will be actuated at $T_j = \text{approx. } 150^\circ\text{C}$, but it is automatically reset when the chip temperature drops below the above set level.
5. The overvoltage protection circuit starts its operation at $V_{CC} = \text{approx. } 20 \text{ V}$.
6. Take into consideration the heat radiation design particularly when V_{CC} is set high or when the load is 2Ω .
7. When the beep sound function is not used, open the beep sound input pin (pin 10) or connect it to pin 9 with around $0.01 \mu\text{F}$ capacitor.
8. Connect only pin 9 (ground, signal source) to the signal GND of the amplifier in the previous stage. The characteristics such as distortion, etc. will improve.
