Notes: 1. Transition is measured ±200 mV from high impedance voltage with Load (B). This parameter is sampled and not 100% tested.

2. A write occurs during the overlap (t_{WP}) to a low $\overline{CS}$ and a low $\overline{WE}$.

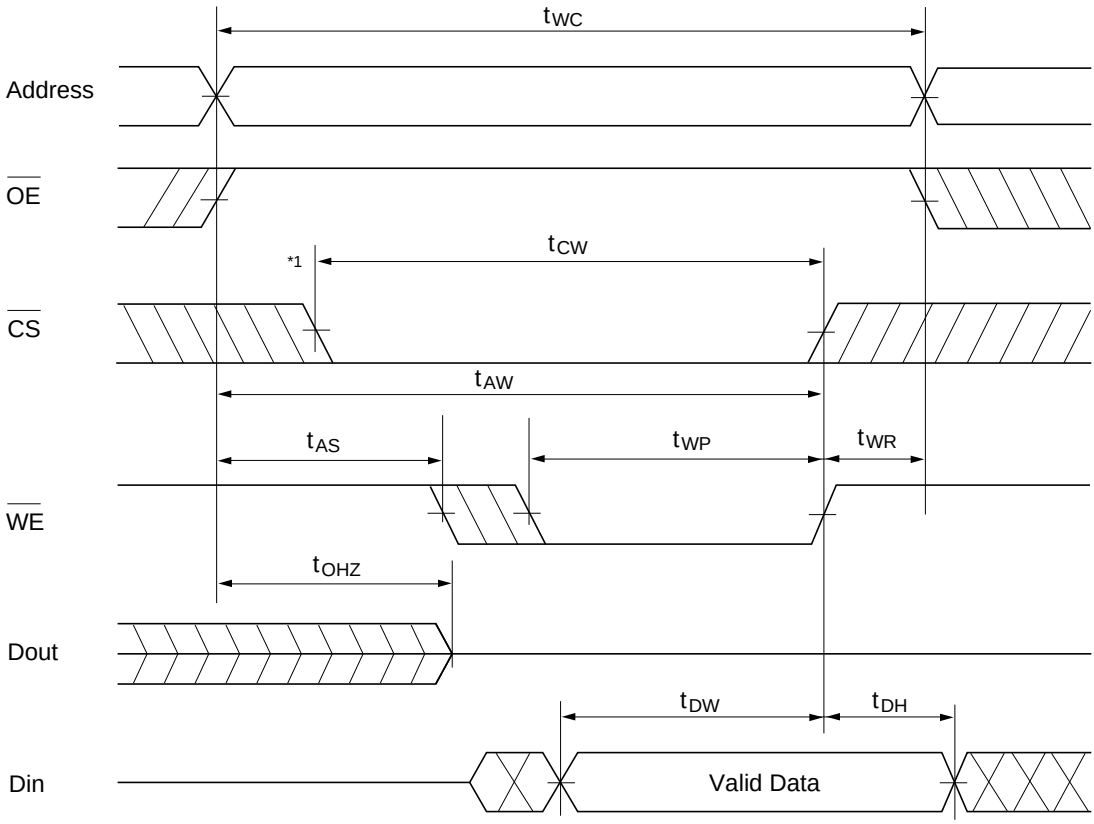
3. t_{WR} is measured from the earlied or $\overline{CS}$ or $\overline{WE}$ going high to the end of write cycle.

4. During this period, I/O pins are in the output state so that the input signals of the opposite phase to the outputs must not be applied.

5. Dout is the same phase of write data of this write cycle.

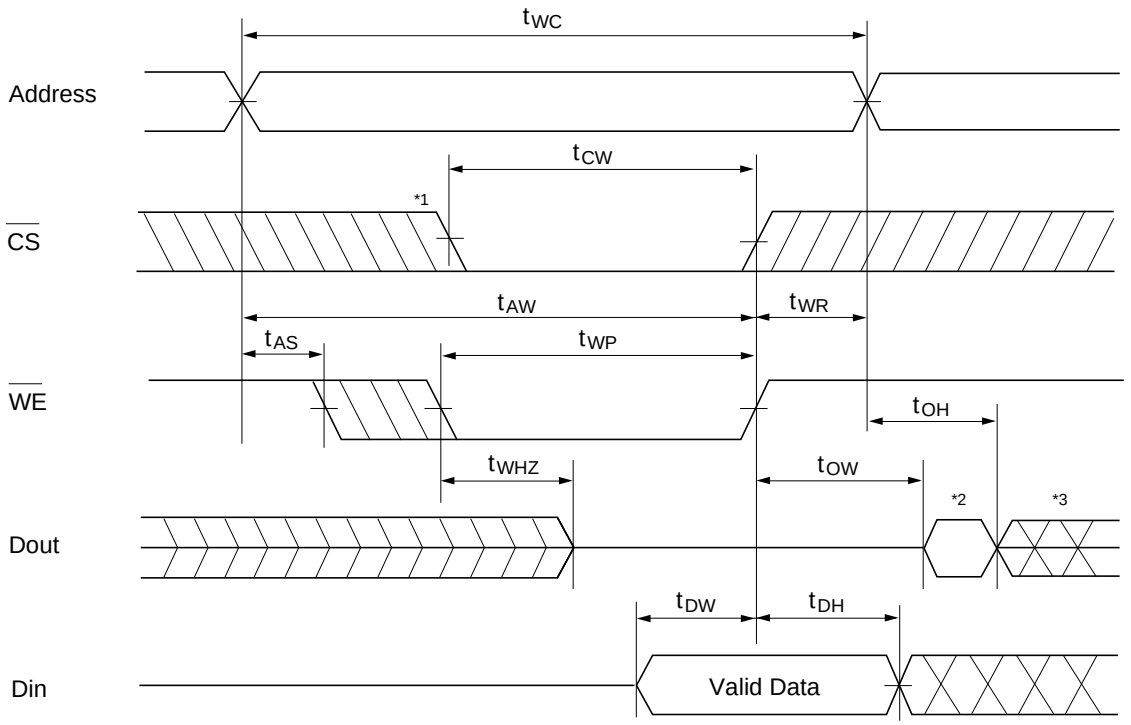
6. If $\overline{CS}$ is low during this priod, I/O pins are in the output state. Then the data input signals of opposite phase to the outputs must not be applied to them.

Write Timing Waveform (1)



Note: 1. If the $\overline{CS}$ low transition occurs simultaneously with the $\overline{WE}$ low transition or after the opposite phase to the outputs must not be applied.

Write Timing Waveform (2) ($\overline{OE}$ low Fixed)[*4]



Notes: 1. If the $\overline{CS}$ low transition occurs simultaneously with the $\overline{WE}$ low transitions or after the $\overline{WE}$ transition, output remain in a high impedance state.

2. Dout is the same phase of write data of this write cycle.

3. Dout is the read data of next address.

4. $\overline{WE}$ must be high during all address transition except when device is disable with $\overline{CS}$.
