

TSH691

LOW COST 40MHz - 1GHz AMPLIFIER

- 28dB GAIN @ 3V @ 450MHz
- +13.5dBm OUTPUT POWER (P1dB)
- BIAS PIN FOR OUTPUT POWER & AMPLIFIER DISABLE
- 50Ω INPUT/OUTPUT MATCHING

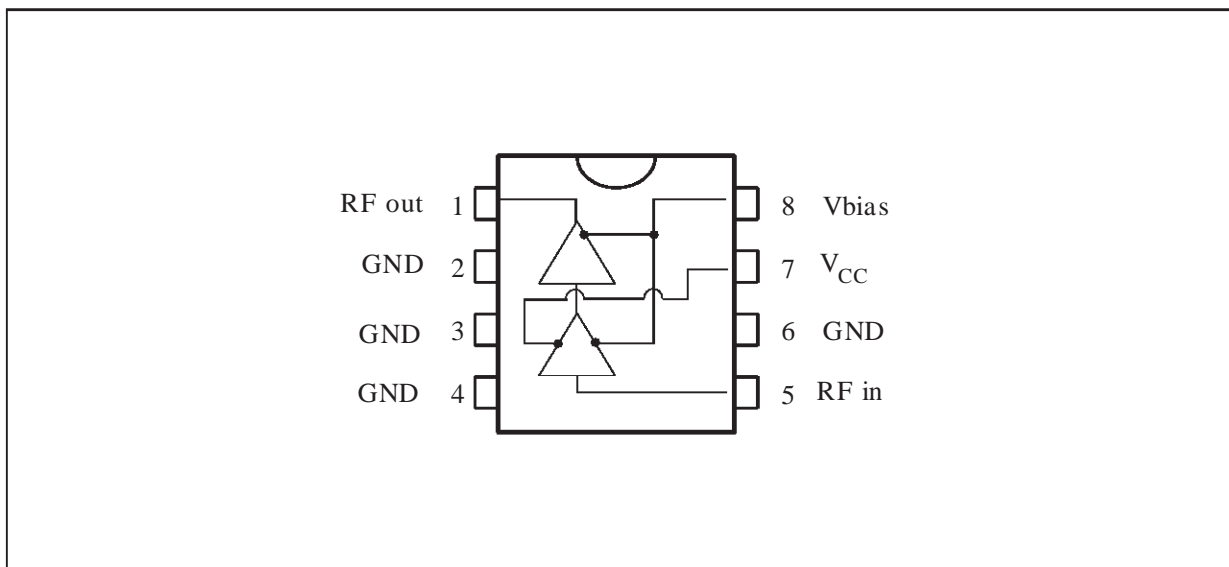

DESCRIPTION

TSH691 is a low cost RF amplifier consisted of 2 stages, designed in advanced bipolar process, featuring high performances. An external bias current adjust allows to tune the output power and also to set the amplifier in power-down mode. The TSH691 is intended to RF consumer equipments in ISM band (remote controls, ASK transmitters) where cost is sensitive

$R_{th(j-a)}$ Junction Ambient Thermal Resistance For SO8 Package	140		180	$^{\circ}\text{C/W}$

All parameters with min. or max. figures are 100% tested.

SO8 PACKAGE THERMAL RESISTIVITY

DEFINITION

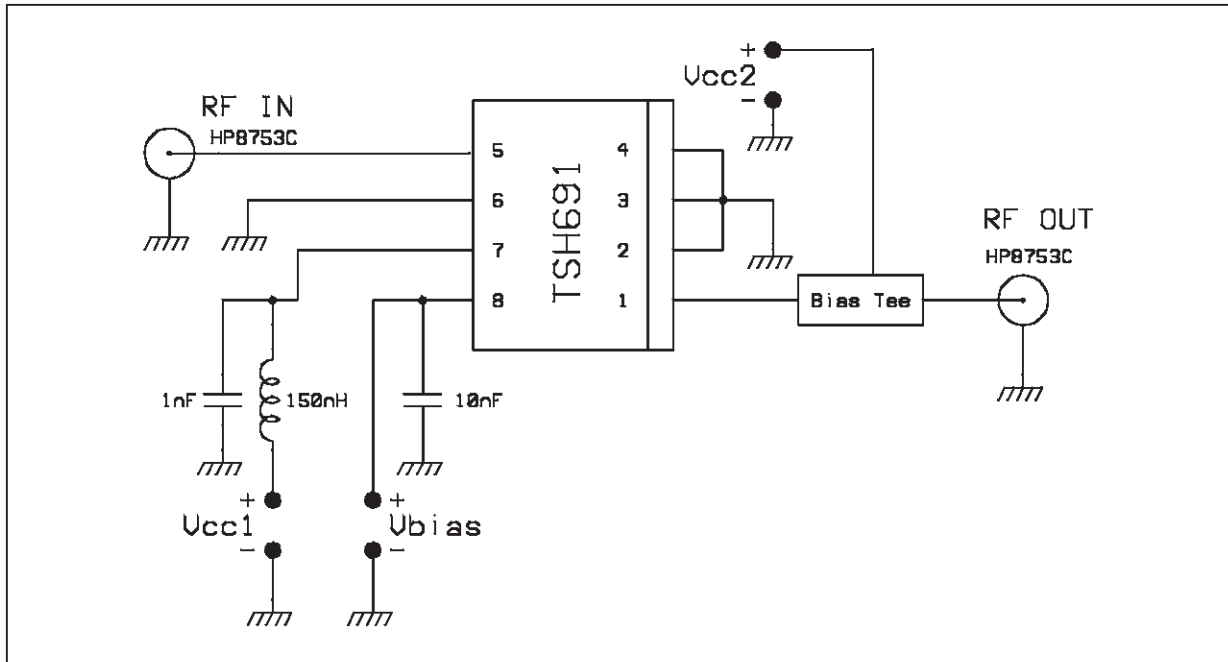

- $R_{th(j-a)}$ Junction Ambient Thermal Resistance
- T_j ($^{\circ}\text{C}$) Maximum Die Junction Temperature (~ 150 $^{\circ}\text{C}$)
- T_{amb} ($^{\circ}\text{C}$) Ambient Temperature
- P_d (W) Maximum Dissipated Power ($P_d = 0.75 V_{CC} \cdot I_{CC}$)

REMARKS

The right behaviour is obtained when the following equation is fulfilled.

$$T_j - T_{amb} = P_d \cdot R_{th(j-a)}$$

TYPICAL SCATTERING PARAMETERS (Reference waves planes at package leads)

TEST CONDITIONS $V_{CC1}, V_{CC2}, V_{bias} = +2V, P_{in} = -40dBm, T_{amb} = 25^{\circ}C$

Figure 1 : Typical 300MHz-1000MHz Biasing Circuit

APPLICATIONS INFORMATION

CIRCUIT DESCRIPTION

The TSH691 is 50Ω input/output internally matched from 300MHz to 1000MHz. Due to its open-collector structure, the output RF port must be tied to V_{CC2}. The pin 8 allows a bias current adjust to set the output power and the gain. The circuit is packaged in SO8 for thermal dissipation considerations.

MATCHING

Within the 300-1000MHz band, although the circuit is matched, the output return loss can be improved by adding a series inductor (L2) between the RF output and V_{CC2} (56nH @450MHz and 10nH @900MHz). Below 300MHz, using the S-parameters matrix, specific input/output matching networks can be calculated to maximize electrical performances.

DC BLOCKING

Because input/output are respectively internal/external biased, DC blocks (C1, C2) are recommended on both RF ports to guarantee a DC isolation from the next cells. Above 500MHz, 100pF is suggested whereas below, 1nF is better and far below (less than 100MHz), 10nF is preferred.

BIASING

The amplifier can operate in the range of 1,5V to 5V and offers a bias current adjust function (V_{bias} pin) which enables the trimming of the RF output

power (AB class Amplifier) by tuning a series variable resistor (R_{bias}).

When V_{bias} is wired to the V_{CC} rail, the current consumption is maximized getting the best linearity (A class Amplifier) whereas biasing to Ground, the IC is set in power down mode.

For higher supply voltage than 4V to reach high output power, the serial resistor (R1) is strongly recommended to increase the efficiency of the amplifier and therefore reduce the thermal dissipation of the circuit.

DECOUPLING

As with any RF devices, the supply voltage decoupling must be done carefully using a 1nF bypass capacitor (C3, C5) placed as close as possible to the device pins and could be also improved by adding a 150nH RF choke inductance (L1). Concerning the V_{bias} pin, a 10nF decoupling capacitor (C4) is recommended while placing on board is not critical. Note that Surface Mounted Devices (SMD) components are preferred for RF applications due to the right behaviour in high frequencies while low inductor values (few 10nH) can be printed on board.
