M3541

## SINGLE NUMBER PULSE TONE SWITCHABLE DIALER

PRELIMINARY DATA

- SELECTABLE LOOP DISCONNECT OR DTMF DIALLING MODES
- ALLOWS USER TO SWITCH FROM LD TO DTMF DIALLING DURING A CALL
- LNR FACILITY ALLOWS UP TO 31 DIGITS TO BE RETAINED FOR REDIALLING
- SELECTABLE MAKE/BREAK RATIOS 2:1 AND 3:2
- SELECTABLE INTERDIGIT PAUSE 500 ms OR 800ms
- USES INEXPENSIVE 560KHz RESONATOR
- TIMED BREAK RECALL (timed flash)
- OPERATES WITH INEXPENSIVE SINGLE CONTACT KEYPAD
- CAPABLE OF BATTERY-LESS OPERATION. LOW POWER CMOS PROCESS ALLOWS DIRECT OPERATION FROM TELEPHONE LINES

## DESCRIPTION

The M3541 is a keypad switchable LD/DTMF dialer devices designed for use in low cost, dual dialing mode telephone instruments. It is suitable for sending telephone numbers without limit and an on-chip memory allows numbers of up 31 digits to be retained for redialling later. The low power CMOS design allows the number in the memory to be maintained indefinitely (until overwritten) by a minimal current leaked from the telephone line. A particular feature of this device is the facility for the user to switch dialling mode from LD to DTMF via the keypad during the course of a call. This is intended for uses such as home banking, access to long distance trunk service, credit card verificatios and other applications which require data to be sent at low speed once a connection has been established.

## PIN CONNECTION (Top view)

## ABSOLUTE MAXIMUM RATINGS

| Symbol | Parameter | Min. | Typ. | Max. | Unit |

* Stresses above those listed under 'Absolute Maximum Ratings' may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other condition above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum ratings for extended periods may affect device reliability.
D. C. ELECTRICAL CHARACTERISTICS (VDD $=2.5 \mathrm{~V}, \mathrm{~T}_{\text {amb }}=25^{\circ} \mathrm{C}$ unless otherwise specified)

PIN FUNCTIONS

| Pin Name |  |
| :---: | :--- |
| ROW 1 |  |
| ROW 2 |  |
| ROW 3 |  |
| ROW 4 | Connections for 16 Buttons, Single Contact Keyboard |
| COL 1 |  |
| COL 2 |  |
| COL 3 |  |
| V 4 | Positive Supply |
| VSS | Negative Supply |
| SELECT | LD/MF Selection, IDP and B/M Ratio Programming |
| OSCIN - OSCOUT | Oscillator Connection |
| HSW | Hookswitch. A logic '1' voltage at this pin is used to indidcate 'off-hook'. |
| MASK | Output to disable speech circuit during pulse dialling and recall (see note 1). |
| IMP | 'Loop Disconnect' Dialling Output |
| MF OUT | Unfiltered, Dual Tone Output |
| FILTOUT - FILTIN | Unity Gain Amplifier Input and Output for 2-pole Filter |
| MUTE | Output Active During Keying and Tone Transmission (see note 2) |

Notes : 1. The $\overline{\text { MASK }}$ output may beused to disconnect the whole speech circuit in order to maintain the break condition whilst on-hook, during a TBR (Timed Flash) operation or for LD dialling.
2. The MUTE output is provided to disable the microphone while maintaining the loop condition during DTMF transmission.

## KEYPAD OPERATION

The device will accept keypad inputs only in the 'offhook' condition when the key is pressed for more than 14 ms . Any key pressed during the 'on-hook' condition will be ignored and the oscillator inhibited. This ensures that the current drain 'on-hook' is low and used only for memory retention.

## KEYPAD FORMAT

| C1 [2 [3 [4 |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| R1 | 1 | 2 | 3 | TBR |
| R2 | 4 | 5 | 6 | LNR |
| R3 | 7 | 8 | 9 |  |
| R4 | * | 0 | $\#$ |  |

LNR = Redial digits in "LNR"store TBR = Timed Break Recall (timed flash)

## LD/DTMF MODE SELECTION

The initial dialling mode afterthe telephonegoes offhook is determined as follows :
DTMF - Connect SELECT pin to $V_{D D}$
LD -

| Option |  | Connect SELECT <br> pin to : |
| :---: | :---: | :---: |
| IDP | B/M Ratio |  |
| VSS |  |  |
| 800 ms | $2: 1$ | COL 1 |
| 500 ms | $2: 1$ | COL 2 |
| 500 ms | $3: 2$ | COL 3 |
| 800 ms | $3: 2$ |  |

LD dialling is at 10 i.p.s. for all options

## KEYPAD LD/DTMF MODE CHANGE

If the initial dialling mode is LD, pressing either the * or \# key will cause all subsequentlyentered digits to be dialled in DTMF. The first press of either * or \# will not cause a digit to be dialled, but once in MF mode, pressing * or\# will cause the appropriate tone pair to be transmitted.
If the TBR (Timed Flash) key is pressed, or an Earth Loop Recall operation is signalled to the chip, further dialling is set to the initial mode.

## LAST NUMBER REDIAL

The function of the Last Number Redial store is to automatically retain the last number dialled so that it can be redialled later simply by pressing the LNR key. Either LD or MF numbers will be retained in the store. When numbers containing an LD part followed by an MF part are dialled, only the LD part will be retained in order that security codes, etc., dialled in MF are not automatically stored.
To redial a number, go off-hook and press LNR once. Alternatively, digits may be keyed manually before LNR is pressed. If the digits keyed correspond with the first digits in the LNR store, the remaining digits will be automatically redialled when LNR is pressed (this feature allows manual keying of an access code followed by a pause before dialling out the rest of the number). If, however, a digit is keyed which differs from the corresponding digit in the stored number, then redialling is inhibited.

## HOOKSWITCH OPERATION

The hookswitch input is used to inform the M3541 of whether the telephone is on- or off-hook. When the telephone is on-hook the M3541 will adopt a static low power mode in which dialling functions are inhibited and only a minimal current is consumed to maintain the store contents.

The M3541 recognizes the on-hook condition when the hookswitch input (HSW) goes from logic '1' (the off-hook condition) to logic ' 0 ' for greater than 300 ms . Short line voltage interruptions of less than 200 ms , such as those created by the exchange during connection, will not be recognized by the M3541 as an on-hook indication.
The MASK output will go to logic ' 0 ' instantly whenever, and for as long as, the hookswitch input is at logic '0' in order to disconnect the speech circuit. This conserves current so that the store contents are not lost.

## POWER-ON RESET

A Power-on Reset is internally generated when power is applied to the chip and causes the number store to be cleared.

## LOOP DISCONNECT MODE

In this mode the MASK output is used to disable the speech circuit during dialling. The MASK output is logic ' 0 ' during impulsing and interdigit pauses.
The IMP output signals a break to line when at logic ' 0 ' (VSS). Make periods and I.D.P. times are signalled by logic ' 1 ' on the output. During the non-dialling period the impulsing output is at logic ' 0 '. Timing of the output is shown below.

Figure 1 : Timing Diagram

FIgure 2 : Timing Data

## DTMF MODE

The MUTE output goes to logic ' 1 ' when a key is activated and remains active for the duration of the tone transmission.
The tone rate will be 100 ms on, 100 ms off minimum.
TONE FREQUENCIES

| Keypad | R1 | R2 | R3 | R4 | C1 | C2 | C3 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Nominal Frequency (Hz) | 697 | 770 | 852 | 941 | 1209 | 1336 | 1477 |
| Deviation from Nominal (\%) | -0.07 | -0.10 | +0.19 | -0.15 | -0.17 | -0.20 | -0.22 |

There will be an additional error due to the deviation of the oscillator frequency from 560 KHz .
Figure 3 : Timing Diagram.

## TONE OUTPUT

Facility has been made for tone filtering as shown below. This also allows the user to adjust tone am-
plitudes as required. The tone amplitude is proportional to the chip supply voltage, $\mathrm{V}_{\mathrm{DD}}$, and can be adjusted by changing the ratio of R3 and R4.

Figure 4.

The filter components shown have been chosen to give a second order Butterworth response with a cut-off frequency of about 3.5 kHz . The pass-band insertion loss is nominally 0.5 dB .

## DTMF APPLICATION CIRCUITS

The DTMF circuit in figure 5 uses a constant current supply and a 2.5 V reference diode to produce the stabilised supply voltage which determines the MF tone level of the M3541. If the speech circuit pro-
vides a stabilised voltage, then figure 6 shows how it may be used to power the M3541. Diode D1 prevents the speech circuit from taking current whilst the telephone is on-hook, and D2 compensates for the voltage dropped across D1 when off-hook.

Figure 5.

Figure 6.

## SWITCHABLE LD/MF APPLICATION CIRCUITS

The circuit in figure 7 uses a constantcurrent supply to take current from the telephone line which is used to power the M3541. The 2.5 V reference diode produces a stabilised supply voltage which determines the MF tone level of the M3541.
In figure 8, a stabilising voltage from the speech is used to supply the M3541 during MF dialling to give accurate tone levels.

The M3541 is powered via the 150 K resistor during TBR operations and LD dialling breaks, and via Q1 during dialling makes. This configuration minimises the component count at the expense of allowing a leakage current of about $450 \mu \mathrm{~A}$ during dialling breaks. The $47 \mu \mathrm{~F}$ reservoir capacitor maintains and smooths the supply to the chip.
