Description

Hewlett-Packard's AT-42010 is a general purpose NPN bipolar transistor that offers excellent high frequency performance. The AT-42010 is housed in a hermetic, high reliability 100 mil ceramic package. The 4 micron emitter-to-emitter pitch enables this transistor to be used in many different

functions. The 20 emitter finger interdigitated geometry yields a medium sized transistor with impedances that are easy to match for low noise and medium power applications. This device is designed for use in low noise, wideband amplifier, mixer and oscillator applications in the VHF, UHF, and microwave frequencies. An optimum noise match near $50\ \Omega$ up to 1 GHz, makes this device easy to use as a low noise amplifier.

The AT-42010 bipolar transistor is fabricated using Hewlett-Packard's 10 GHz f_T Self-Aligned-Transistor (SAT) process. The die is nitride passivated for surface protection. Excellent device uniformity, performance and reliability are produced by the use of ion-implantation, self-alignment techniques, and gold metalization in the fabrication of this device.

V _{EBO}	Emitter-Base Voltage	V	1.5
V _{CBO}	Collector-Base Voltage	V	20
V _{CEO}	Collector-Emitter Voltage	V	12
I _C	Collector Current	mA	80

Thermal Resistance^[2,4]:

$$\theta_{jc} = 150^{\circ}\text{C}/\text{W}$$

Notes:

1. Permanent damage may occur if any of these limits are exceeded.
2. T_{CASE} = 25°C.
3. Derate at 6.7 mW/°C for T_C > 110°C.
4. The small spot size of this technique results in a higher, though more accurate determination of θ_{jc} than do alternate methods. See MEASUREMENTS section "Thermal Resistance" for more information.
