

**LC75281E****Parametric Equalizer System****Overview**

The LC75281E is a four-band stereo parametric equalizer. A parametric equalizer is a fully general equalizer that allows all three parameters that define an equalizer's characteristics, i.e., the center frequency, gain, and Q, to be set independently.

Functions

- Four-band (low, low mid, high mid, and high) left and right channels parametric equalizer
- For each band:
 - Center frequency: 11 positions
 - Gain: 13 positions in ± 2 dB steps
 - Q: Variable over 8 positions
- The center frequency, gain, and Q control settings are set using serial data input in the CCB format.

Features

- A parametric equalizer with the following features can be implemented with just two ICs: this IC and a microcontroller.
- The center frequency, gain, and Q can be controlled by a single operation.
- Memory recall by a single operation can be implemented using preset values.
- Either shelving or peaking characteristics can be selected for the low band.

External capacitor calculations

Figure a shows the LC75281E internal f_0 control circuit. The center frequency f_0 can be set to one of 11 frequencies in 1/3 octave steps by switching the resistors in the figure.

The value of the external capacitor C is determined by substituting the desired center frequency in the following formula.

$$C_f = \frac{1}{2\pi R_f f_{o \max}} \cdot \frac{R_b/R_f}{R_a + (R_b/R_f)}$$

$f_{o \max}$: Corresponds to 315 Hz in the low band row in the preceding table.

LC75281E

Data Input Procedure

The LC75281E is controlled by inputting the stipulated serial data to the CE, CL, and DI pins. The data consists of 28 bits, of which 8 bits are the address and 20 bits are the data.

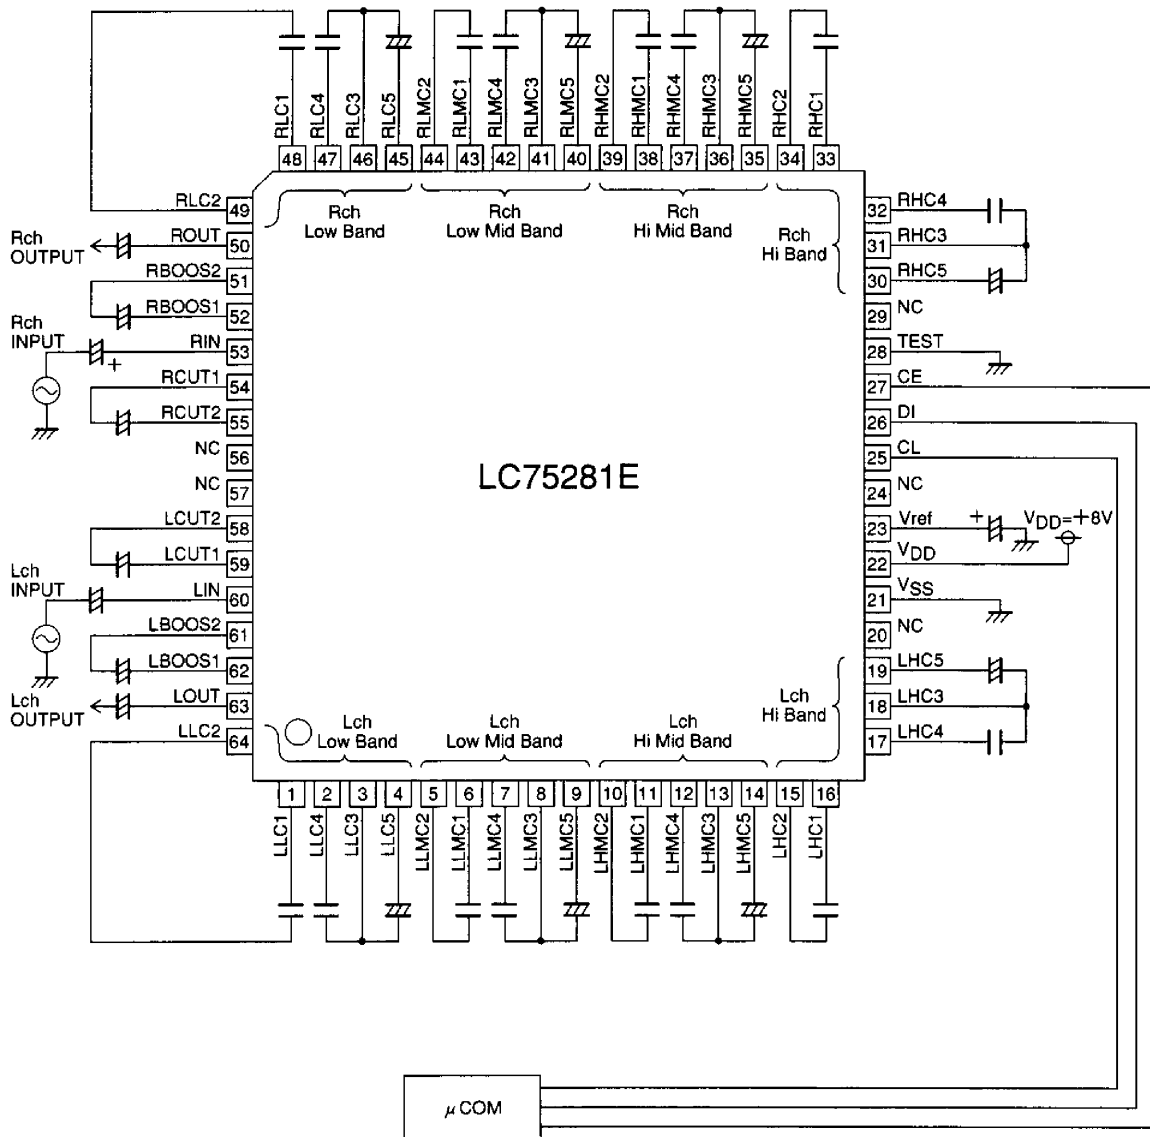

A10687

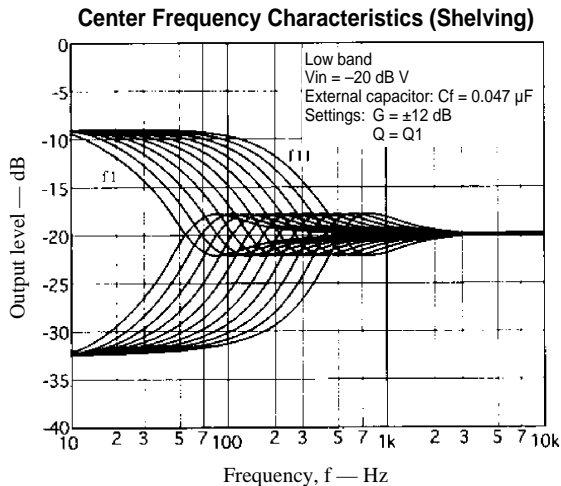

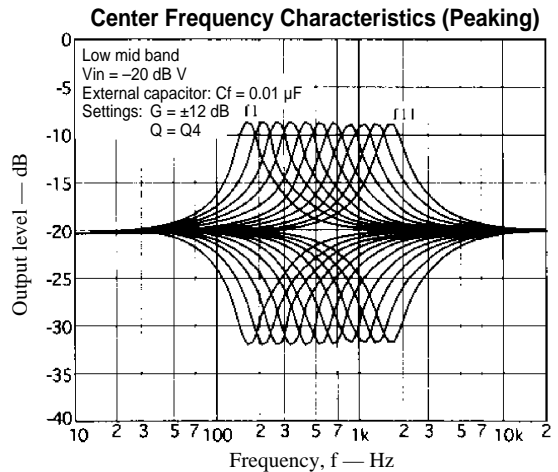

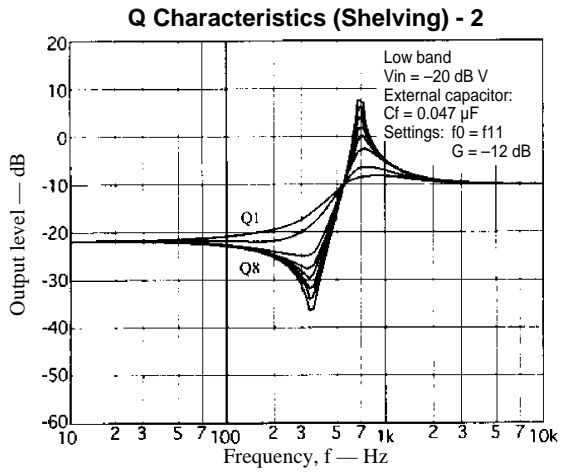

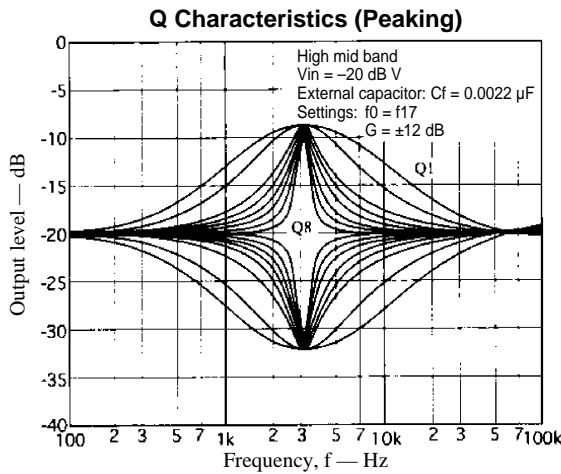

Note *: The 2x command doubles the center frequency of all bands. When setting this bit to 1, applications must either enter the band data for one of the bands in bits D1 to D19, or must set both bits D4 and D5 to 0, in which case all other bits are ignored.
