GENERAL DESCRIPTION

The MX98702 100Base-TX PMD transceiver is an integrated circuit capable of transmitting and receiving of 125 Mbaud three level (MLT-3) encoded data stream. It allows links of up to 100 meters of UTP (Unshielded Twisted paired cable) (over Category 5) and STP (Shielded Twisted paired cable).

FUNCTIONAL DESCRIPTION

The TON and TOP are generated from the input of TIP and TIN through the MLT-3 encoder. The outputs are either XRZI or MLT3 waveform depending on the input of ENCS. When ENCS is low the TON and TOP are NRZI outputs. When ENCS is high the TON and TOP are MLT-3 outputs.

The EQS will provide the choice of equalization. If pin EQS is over 2/3 of VDD, the equalization function is turn off. If it is below 1/3 of VDD, there will be a equalization for maximum length.

After the receive inputs are equalized, they will go ahead to the MLT-3/NRZI decoder, and then the Lookback control block. Finally, the RON and ROP with PECL level come out off the chip.

SDP and SDN are generates to indicat that either a valid signal is present at RIN and RIP inputs or that loopback mode has been selected.

SDP and SD are also PECL level.

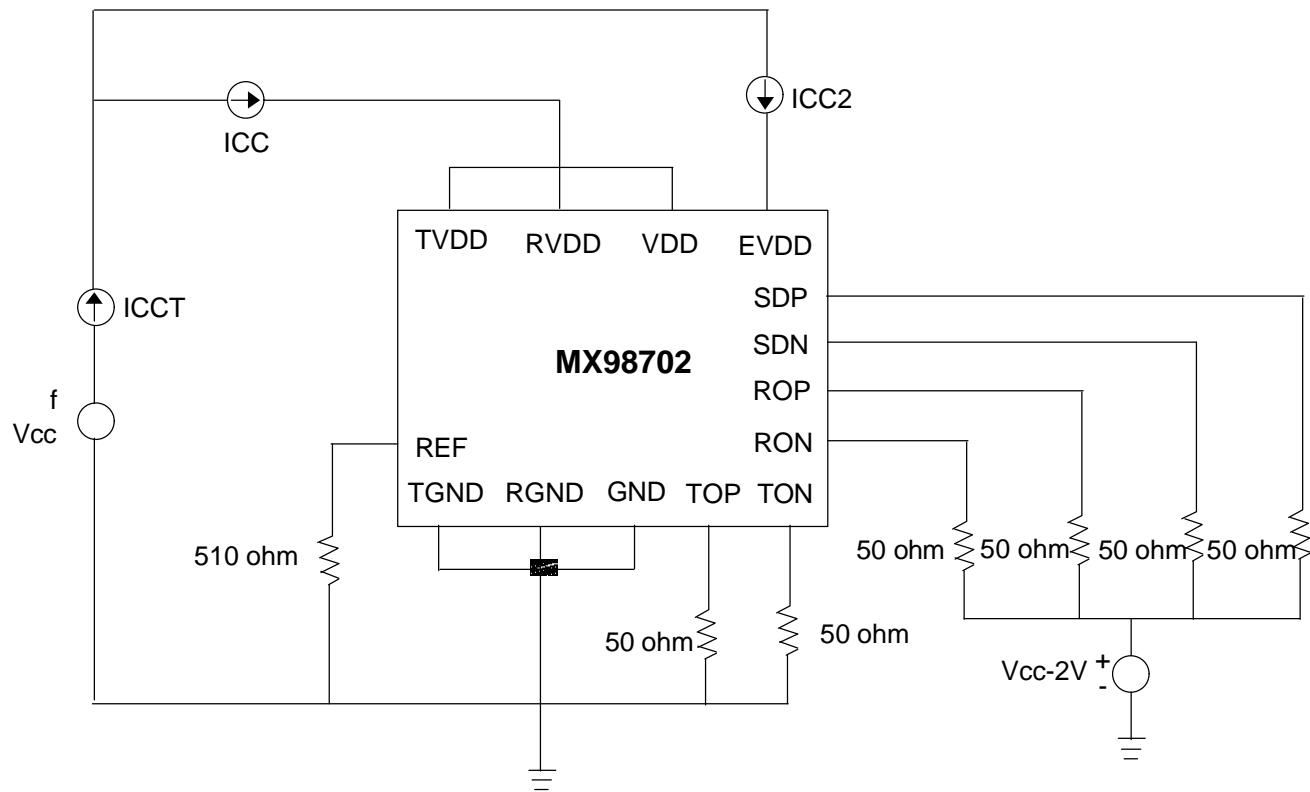

A voltage to current converter are integrated in the chip. The converter provides the reference current for transmit output. The current can be controlled through an external register which is connected to the REF pin.
