

January 2003

Features

- Very High Operating Speed
- Operation down to DC with Square Wave Input
- Low Phase Noise (Typically better than -147dBc/Hz at 10kHz)
- 5V Single Supply Operation
- Low Power Dissipation: 480mW (Typ)
- Surface Mount Plastic Package With Exposed Pad (See Application Notes)

Applications

- DC to 10 GHz PLL applications
- HyperLan
- LMDS
- Instrumentation
- Satellite Communications
- Fibre Optic Communications; OC48, OC192
- Ultra Low Jitter Clock Systems

Ordering Information

ZL40810/DCE (tubes)	8 lead e-pad SOIC
ZL40810/DCF (tape and reel)	8 lead e-pad SOIC
-40° to +85°C	

Description

The ZL40810 is one of a range of 5V supply, very high speed low power prescalers for professional applications with a fixed modulus of divide by 8. The dividing elements are static D type flip flops and therefore allow operation down to DC if the drive signal is a pulse waveform with fast rise times. The output stage has internal 50 ohm pull up giving a 1V p-p output. See application notes for more details.

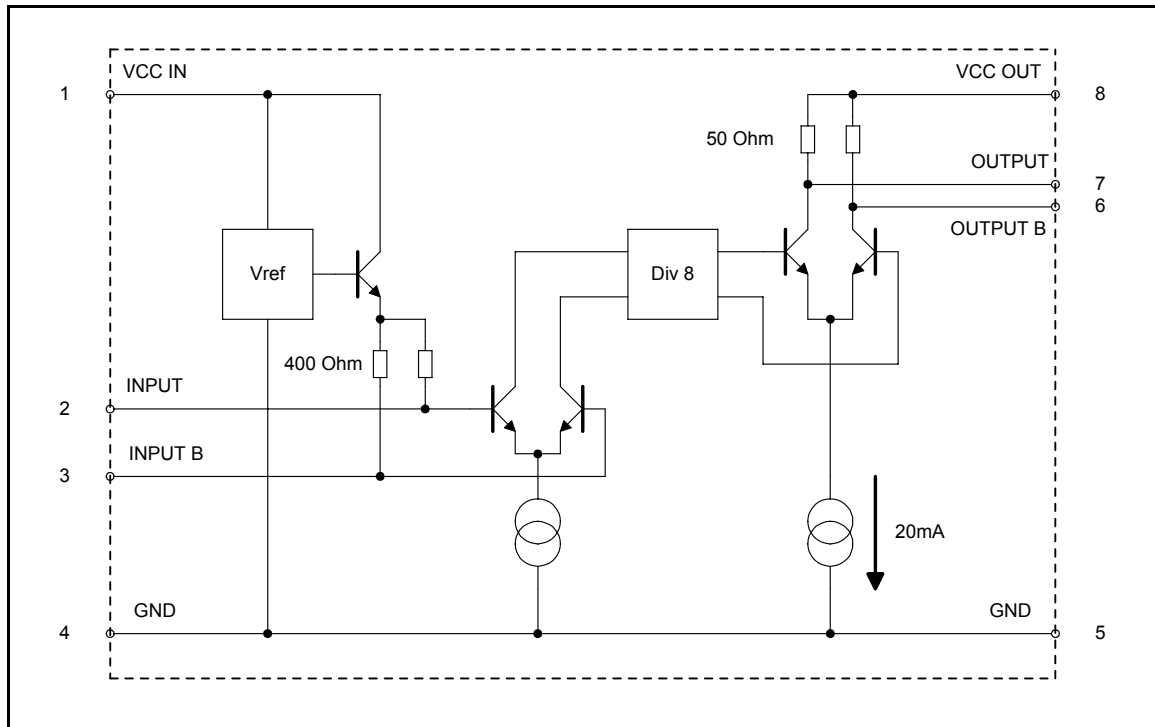

Figure 1 - Block Diagram

Pin Connections - Top View

Application Configuration

Figure 2 shows a recommended application configuration. This example shows the devices set up for single ended operation.

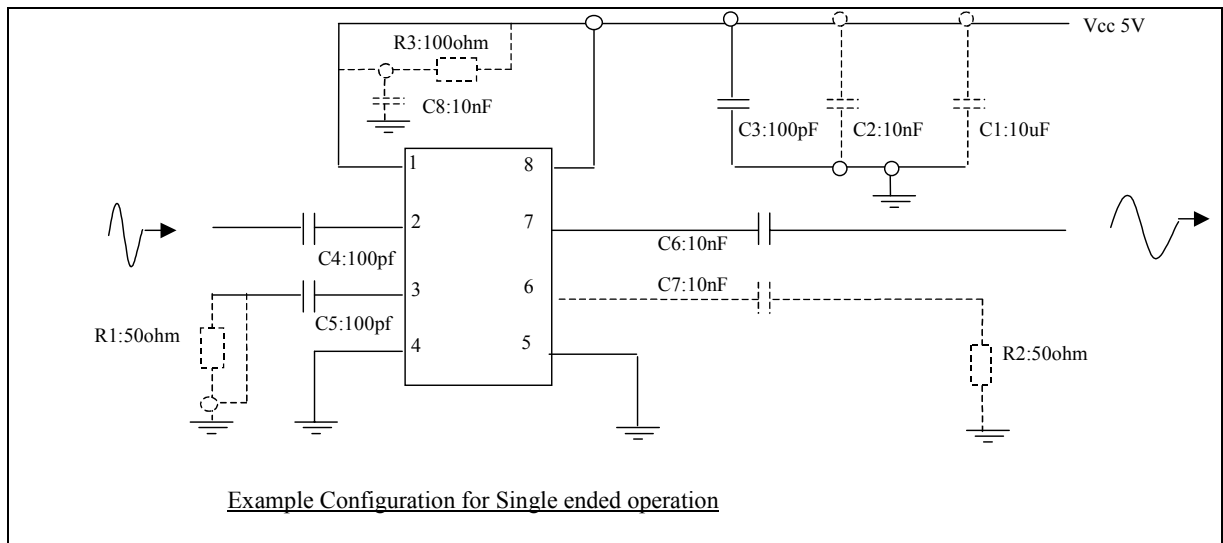

Figure 2 - Recommended circuit configuration

The above circuit diagram shows some components in dotted lines. These are optional in many applications.

1. C1 (10 μ F) and C2 (10 nF) power supply decoupling capacitors may be available on the board already.
2. R3 (100 Ohm) and C8 (10 nF) can be included if further power supply decoupling is required for the first stage biasing circuit. This may optimise the noise and jitter performance. The values are suggestions and may have to be modified if the existing supplies are particularly noisy.
3. R1 (50 Ohm), in series with C5 (100 pF), may reduce feedthrough of the input signal to the output.
4. R2 (50 Ohm) and C7 (10 nF) will help to balance the current drawn from the power supply and may reduce voltage transients on the power supply line.

Evaluation Boards From Zarlink Semiconductor

Zarlink Semiconductor provide a prescaler evaluation board. These are primarily for those interested in performing their own assessment of the operation of the prescalers. The boards are supplied unpopulated and may be assembled for single ended or differential input and output operation. Once assembled, all that is required is an RF source and a DC supply for operation. The inputs and outputs are connected via side launch SMA connectors.

Absolute Maximum Ratings

Electrical Characteristics ($T_{amb} = 25C$, $V_{cc} = 5V$)

	Parameter	Symbol	Min	Max	Units
1	Supply voltage	V_{cc}		6.5	V
2	Prescaler Input Voltage		2.5		Vp-p
3	ESD protection (Static Discharge)		2k		V
4	Storage temperature	T_{ST}	-65	+150	°C
5	Maximum Junction Temp	T_{Jmax}		+125	°C
6	Thermal characteristics	TH_{ja}	58.6		°C/W multi-layer PCB

AC/DC Electrical Characteristics

Electrical Characteristics ($T_{amb} = 25C$, $V_{cc} = 5V$)[†]

Characteristic	Pin	Min.	Typ.	Max.	Units	Conditions
Supply current	1		0.35		mA	Input stage bias current
Supply current	8		96	136	mA	Divider and output stages
Input frequency	2,3	2		11	GHz	RMS sinewave ¹
Input sensitivity	2,3		-8		dBm	$f_{in} = 1GHz$ to $2GHz$
Input sensitivity	2,3		-15	-10	dBm	$f_{in} = 2GHz$ to $9.5GHz$
Input sensitivity	2,3		-10	0	dBm	$f_{in} = 11GHz$
Input overload	2,3		8		dBm	$f_{in} = 1GHz$ to $4GHz$
Input overload	2,3		11		dBm	$f_{in} = 5GHz$ to $11GHz$
Input Edge Speed	2,3	900			V/ μs	For <2GHz operation.
Output voltage	6,7		1		Vp-p	Differential Into 50ohm pullup resistors
Output power	6,7	-3	-1	1.2	dBm	Single-ended output, $f_{in} = 2GHz$ to $10GHz$, $pwr_{ip} = -10dBm$
Phase Noise (10kHz offset)	6,7		-147		dBc/Hz	$f_{in} = 5GHz$, $pwr_{ip} = 0dBm$ See Figure 5 to Figure 8.
O/P Duty Cycle	6,7	45	50	55	%	

1. The device characterisation test method incremented the amplitude over the entire range of frequency and ensures that there are no "holes" in the characteristic.

- † The characteristics are guaranteed by either production test or design.
- † Input sensitivity and output power values assume 50 Ohm source and load impedances

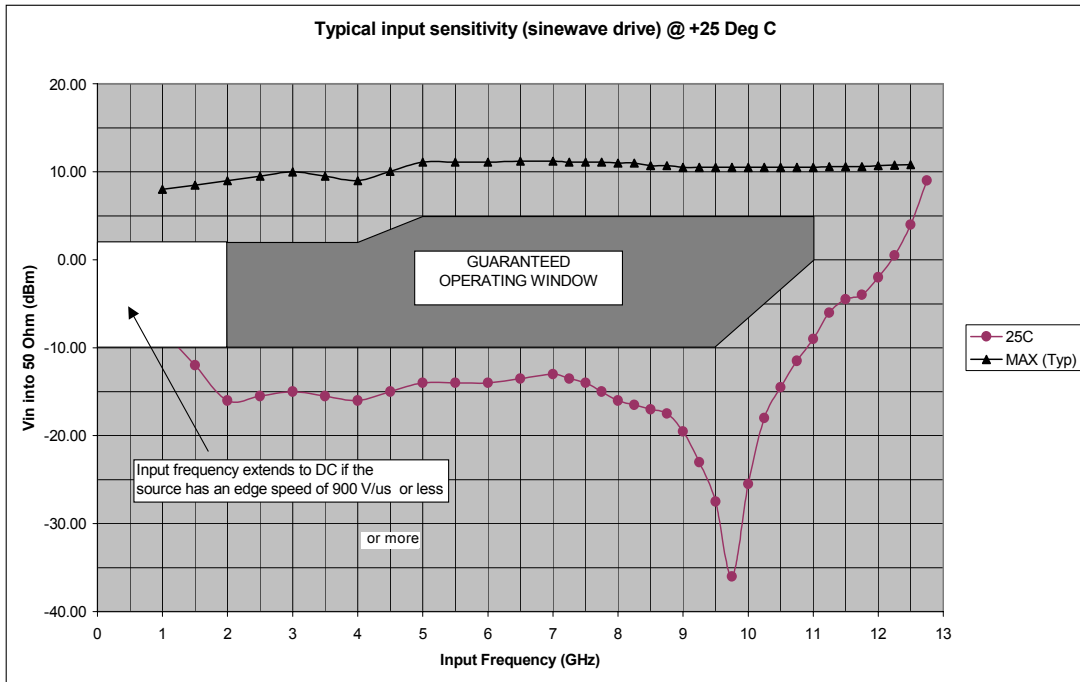

Figure 3 - Input Sensitivity @ +25 Deg C

Electrical Characteristics ($V_{cc} = 5V \pm 5\%$, $T_{amb} = -40$ to $+85C$)[†]

Characteristic	Pin	Min.	Typ.	Max.	Units	Conditions
Supply current	1		0.35		mA	Input stage bias current ¹
Supply current	8	67	96	125	mA	-40 deg C 5.25V
Supply current	8	54	78	101	mA	-40 deg C 4.75V
Supply current	8	74	105	136	mA	+25 deg C 5.25V
Supply current	8	60	86	111	mA	+25 deg C 4.75V
Supply current	8	80	115	149	mA	+85 deg C 5.25V
Supply current	8	62	91	119	mA	+85 deg C 4.75V

1. Pin 1 is the Vcc pin for the 1st stage bias current. In some applications e.g. if the power supply is noisy, it may be advantageous to add further supply decoupling to this pin (i.e. an additional R, C filter, see diagram of the recommended circuit configuration, Figure 2).

The characteristics are guaranteed by design and characterisation over the range of operating conditions unless otherwise stated: (Input Frequency range 1 to 10GHz rms Sinewave)

Input and Output Characteristics[†]

Characteristic	Pin	Min.	Typ.	Max.	Units	Conditions
Input sensitivity	2,3		-15	-10	dBm	Tamb = 85C, Fin = 2 to 8 GHz
Input overload	2,3	2	5		dBm	fin = 2 GHz
Input overload	2,3	2	8		dBm	fin = 4 GHz
Input overload	2,3	5	13		dBm	fin = 9 GHz
Input overload	2,3	5	11		dBm	fin = 10 GHz
Input Edge Speed	2,3	900			V/ μ s	For <2GHz operation ¹ .
Output voltage	6,7		1		Vp-p	Differential Into 50ohm pullup resistors
Output power	6,7	-4	-1	2	dBm	Single-ended output, fin = 2GHz to 10GHz, pwr ip= -10dBm
O/P Duty Cycle	6,7	45	50	55	%	
Trise and Tfall	6,7		110		ps	

1. For an input signal frequency of less than 2GHz, the slew rate of the sinewave signal becomes progressively too slow for the divider.

Input sensitivity and output power values assume 50 Ohm source and load impedances

For details of the test set-up, refer to the Application Note for RF Prescalers.

The following graph summarises the Input and Output Characteristics table

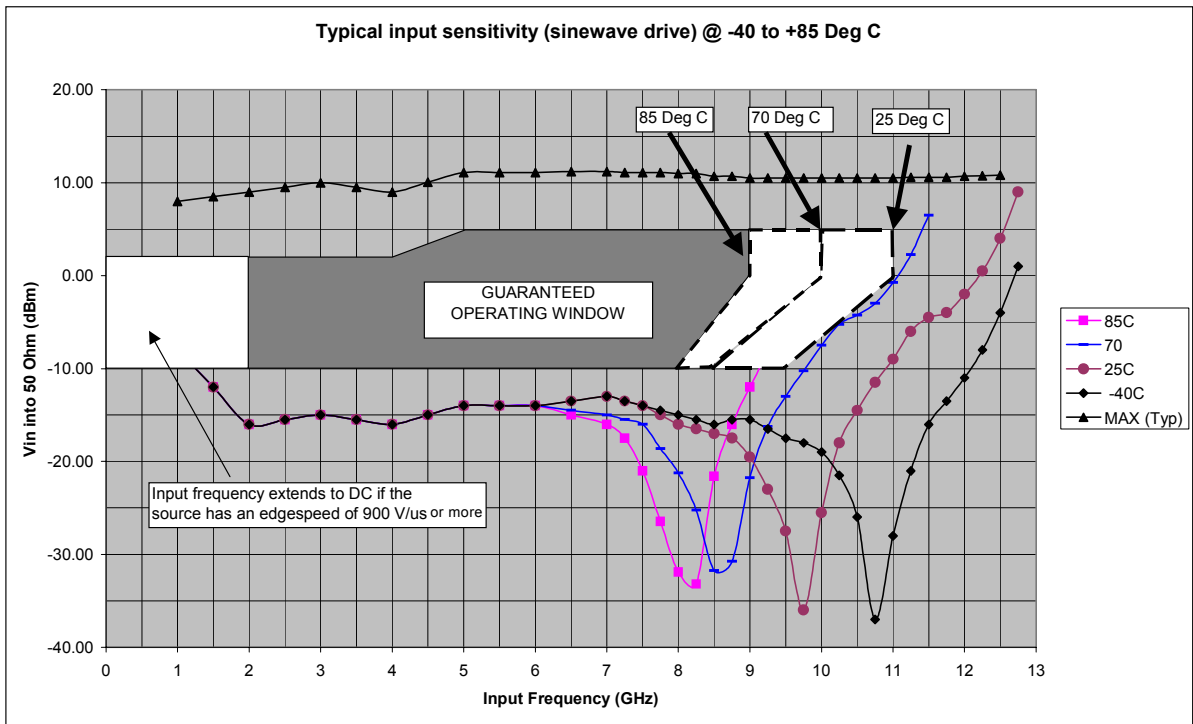

Figure 4 - Input Sensitivity @ -40, +25, +70 and +85 Deg C

Phase Noise Measurement Graphs

The following graph show how the phase noise of the divider output varies with frequency offset from the output (carrier) frequency.

Figure 5 - Figure 8 ZL40810 Phase Noise vs Offset Frequency

The following graph show how the phase noise of the divider output varies with input frequency. The output frequency is the input divided by 8.

Figure 6 - ZL40810 Phase Noise vs Input Frequency

The following graph show how the phase noise of the divider output varies with input power.

Figure 7 - ZL40810 Phase Noise vs Input Power

The following graph show how the phase noise of the divider output varies with power supply voltage Vcc.

Figure 8 - ZL40810 Phase Noise vs Vcc

Single Ended Output Power

The following graphs show how the output power varies with supply.

Differential output power will be 3dB.

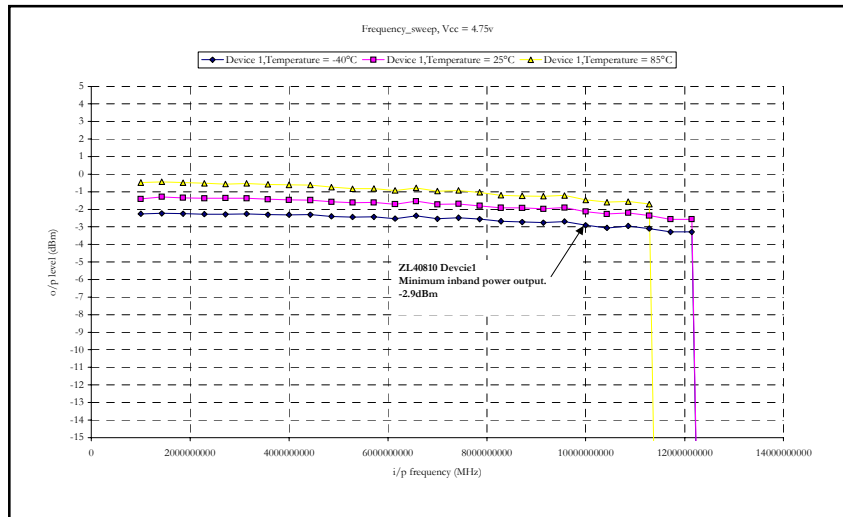

Figure 9 - Pout, Freq, Temp @ Vcc = 4.75

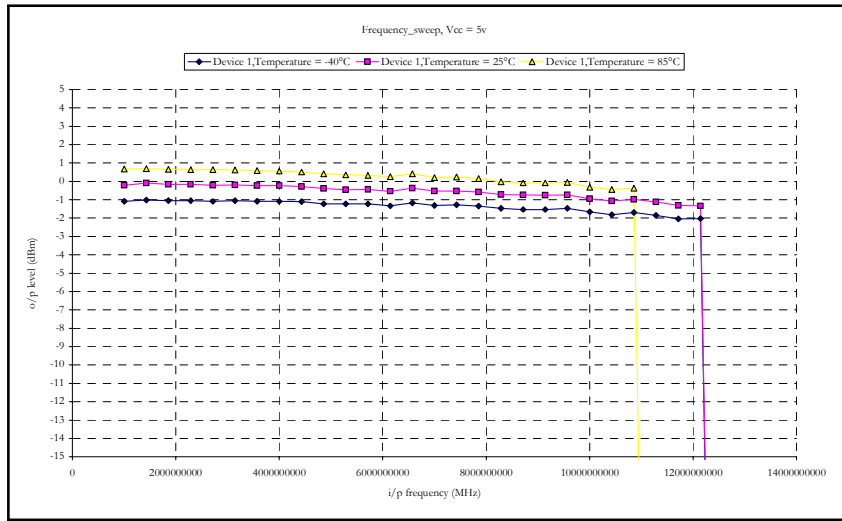

Figure 10 - Pout, Freq, Temp @ Vcc = 5V

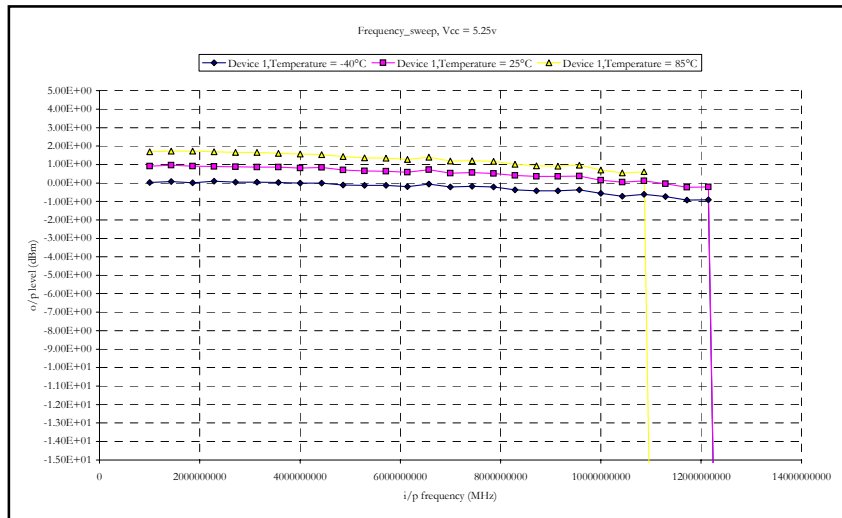

Figure 11 - Pout, Freq, Temp @ Vcc = 5.25V

Oscillographs of the divider output waveforms

The following oscillographs show that the low-level feedthrough of the input waveform can be further reduced by summing the two output pins of the device differentially, refer to Figures 6 and 7.

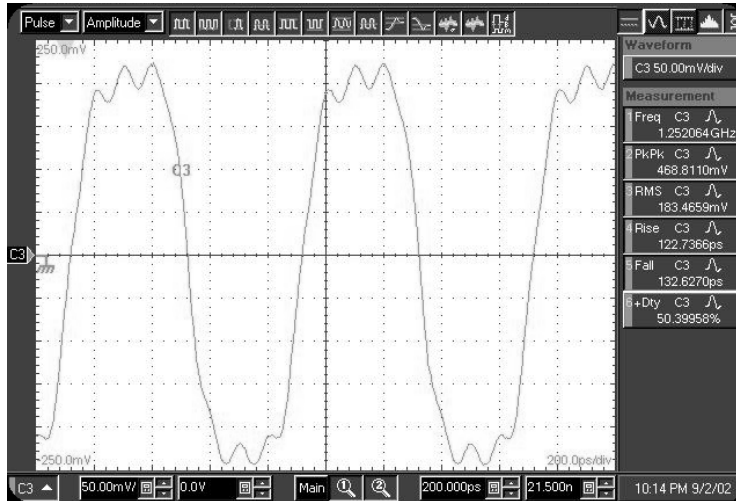

Figure 12 - Feedthrough of the input single-ended output configuration (VCC=5, Vin = 2dBm, Fin = 10GHz)

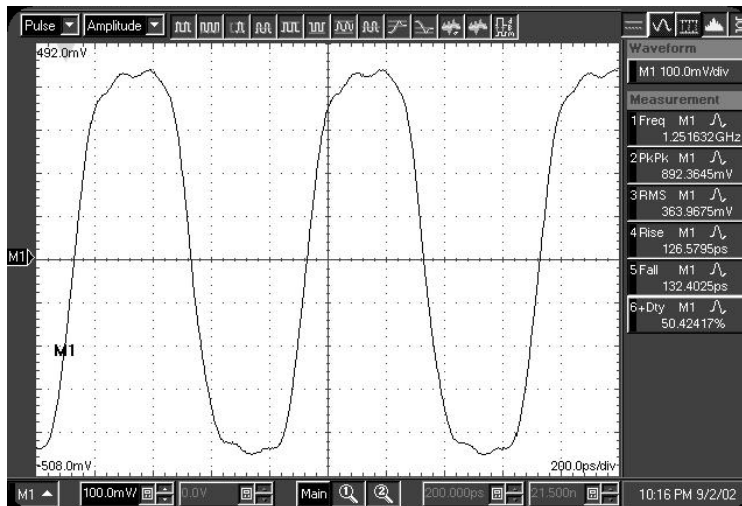

Figure 13 - Feedthrough of the input using differential output configuration (VCC = 5V, Vin = 2dBm, Fin = 10GHz)

Figures 8 and 9 show the output waveforms with a lower input frequency.

Figure 14 - Differential output with small input amplitude (VCC = 4.75V, Vin = -10dBm, Fin = 5GHz)

Figure 15 - Differential output with lower input frequency (VCC = 4.75V, Vin = -10dBm, Fin = 2GHz)

Notes:

1. Controlling dimensions are in inches.
2. Dimensions D & E do not include mould flash, protusion or gate burrs. These shall not exceed 0.006" per side.
3. Exposed paddle not to scale on drawing
4. Extrusion of the exposed pad in bottom side is 0.20 MM Typical
