## Description

The Hitachi HN27C4000FP is a 4-Mbit one time programmable ROM that is organized either as 524288-word × 8-bit or as 262144-word × 16-bit, featuring extra-high speed burst mode that gives two times faster 4-word or 8-byte serial access than normal. And also high speed and fast programming are served as well as the existing Hitachi 4M device HN27C4096 and HN27C4001. Fabricated on advanced fine process and high speed circuitry technique, HN27C4000 makes high speed access time and low power dissipation in either active or stand-by mode. Therefore, it is suitable for all systems featuring high speed microprocessor such as the 80386, 80486, 68030, 68040 and so on.

## Features

- Organization: 524288-word × 8-bit/262144-word × 16-bit ( $\overline{\text{BYTE}}/V_{pp}$  enables selection byte-wide or word-wide)
- High speed:  
Access time 120 ns/150 ns (max)  
Burst access time 60 ns/60 ns (max)
- Low power dissipation:  
Standby mode; 5  $\mu$ W (typ)  
Active mode; 150 mW/MHz (typ)
- Fast high reliability page programming, fast high-reliability programming and option programming:  
Program voltage; +12.5 V DC  
Program time; 3.5 sec (min) (Theoretical in Page programming)
- Inputs and outputs TTL compatible during both read and program modes
- Pin arrangement: 40-pin EIAJ standard pin compatible with HN62414FA/ HN62434FA
- Device identifier mode: Manufacturer code and device code

### Read Timing Waveform

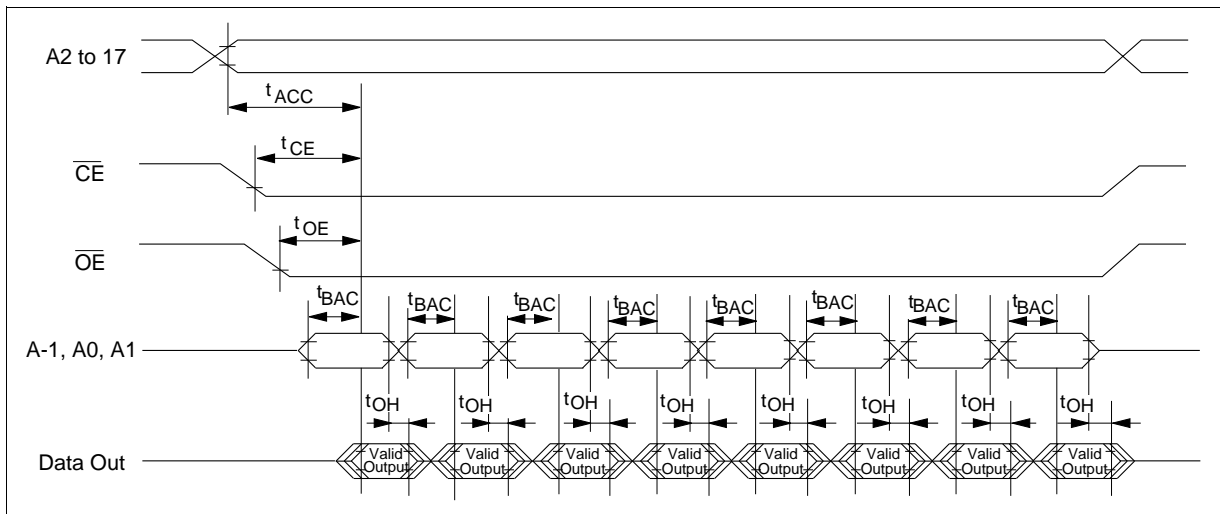

## Read Timing Waveform (Burst access mode)

In Burst Access mode, fast read-out of 4 word data is selected by address A0, A1. (Valid only for Read  $\times$  16 mode)

In Burst Access mode, fast read-out of 8 byte data is selected by address A-1, A0, A1. (Valid only for Read  $\times$  8 mode)

## **Fast High-Reliability Page Programming**

This device can be applied the high performance page programming algorithm shown in the following flowchart. This algorithm allows to obtain faster programming time without any voltage stress to the device nor deterioration in reliability of programmed data.

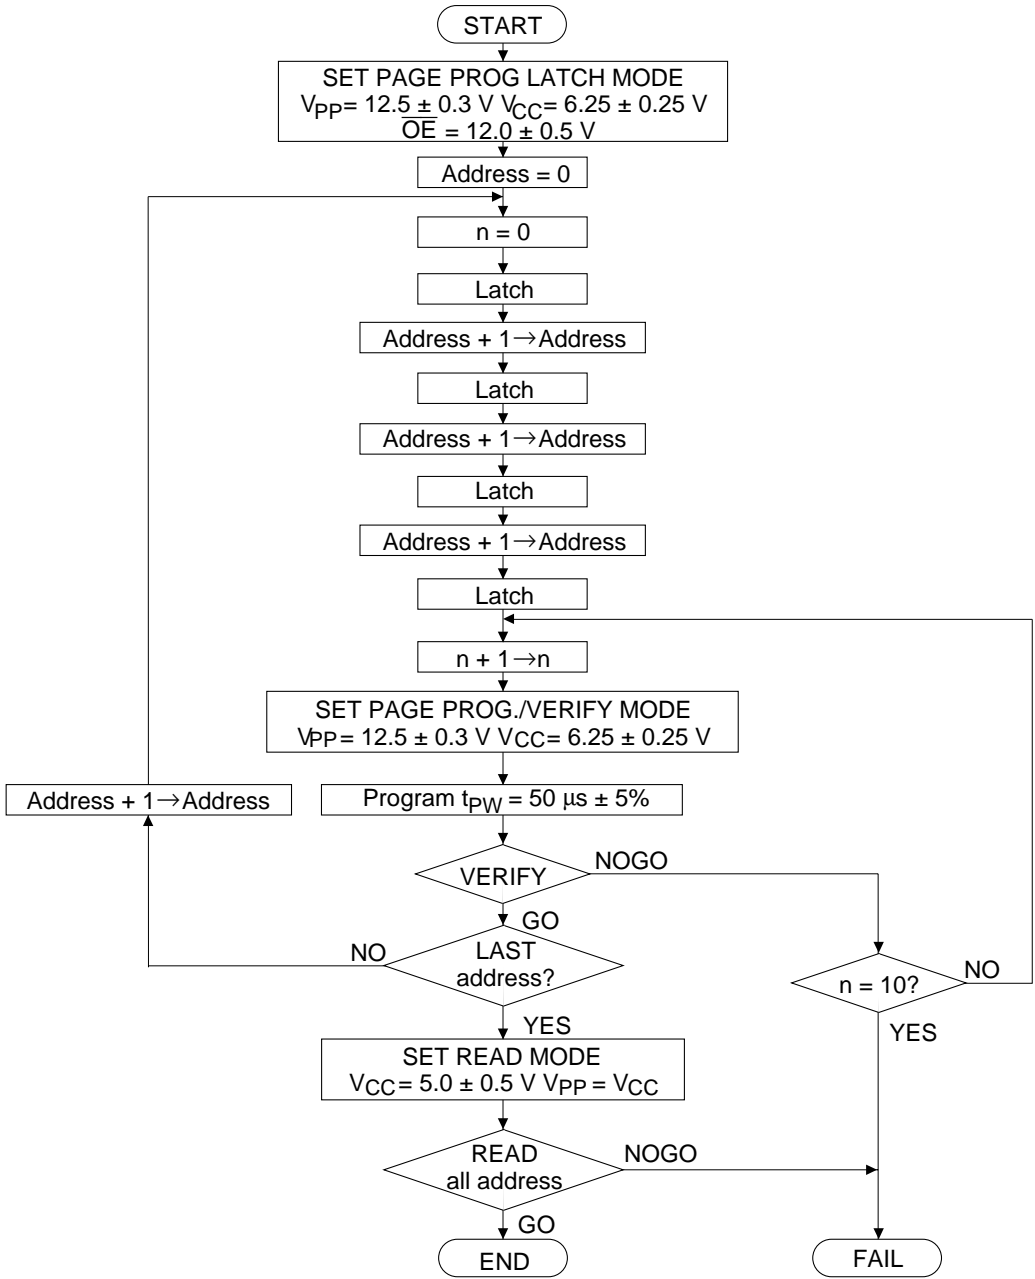

### **Page Program Set**

Apply 12 V to  $\overline{\text{OE}}$  pin after applying 12.5 V to  $V_{\text{pp}}$  to set a page program mode.

The device operates in a page program mode until reset.

### **Page Program Reset**

Set  $V_{\text{pp}}$  to  $V_{\text{CC}}$  level or less to reset a page program mode.

## Optional Page Programming

This device can be applied the optional page programming algorithm shown in the following flowchart. This algorithm allows to obtain faster programming time without any voltage stress to the device nor deterioration in reliability of programmed data.

This programming algorithm is the combination of page programming and word verify. It can avoid the increase of programming verify time when a programmer with slow machine cycle is used, and shorten the total programming time.

Regarding the timing specifications for page programming and word verify, please refer to the specifications for fast high-reliability page programming and fast high-reliability programming.

## Mode Description

### Device Identifier Mode

The device identifier mode allows the reading out of binary codes that identify manufacturer and type of device, from outputs of EPROM. By this mode, the device will be automatically matched its own corresponding programming algorithm, using programming equipment.
