

**DESCRIPTION**

The LX1710/1711 is a monolithic high performance integrated class-D controller IC designed for high efficiency audio requirements such as portable or battery operated products, automotive amplifier, and multimedia applications. This high frequency, full audio bandwidth switching power amplifier controller, is a completely new design with dramatically improved performance over Linfinity's previous generation amplifier products. Enhancements include better SNR, lower noise floor, and reduced THD. Combined with output power MOSFET's and an output filter, the

LX1710/1711 is a complete class-D audio solution. A complete audio amplifier module is available to quickly evaluate the LX1710 controller. Simply connect the amplifier to the power source, audio signal, and speakers. Reference designs support a variety of requirements including multi channel systems, subwoofers, and various speaker loads ( $2\Omega$ ,  $4\Omega$ ,  $8\Omega$ ). The versatile amplifier solution can easily be adjusted for frequency response, optimized for efficiency and performance, or designed to minimize PCB area and component count. The LX1710/LX1711 is available in a space saving 28-pin SSOP package.

**IMPORTANT:** For the most current data, consult MICROSEMI's website: <http://www.microsemi.com>

**PRODUCT HIGHLIGHT**
**Class-D Amplifier Efficiency Comparison**

**KEY FEATURES**

- Integrated Switching Class-D Single Channel Controller IC
- Full 20Hz-20kHz Audio Bandwidth
- High Fidelity (LX1710) Or High Power (LX1711) Versions Available
- Single Supply Operation
- THD+N <0.05% Typical (1Wrms, 1kHz, 4Ω)
- Maximum Efficiency 80%-85%
- Output Power >50Wrms (LX1711, 4Ω, 1% THD+N)
- PSRR -70dB Typical
- Differential Input To Minimize Noise Effects
- Supports Multi-Channel Systems
- Complete LXE1710 Amplifier Evaluation Module Available
- 28-Pin SSOP Package

**APPLICATIONS/BENEFITS**

- Notebook Computers
- Desktop Computers
- Multimedia Speakers
- Automotive Amplifiers And Headunits
- Battery Operated Equipment (Megaphone, PA System)
- Portable Audio (Boom Box)
- Wireless Speakers
- High Power Subwoofer

**PACKAGE ORDER INFO**

| T <sub>J</sub> (°C) | V <sub>DD</sub> | DB Plastic SSOP 28-PIN |
|---------------------|-----------------|------------------------|
| 0 to 70             | 7V-15V          | LX1710CDB              |
|                     | 7V-25V          | LX1711CDB              |

## THERMAL DATA

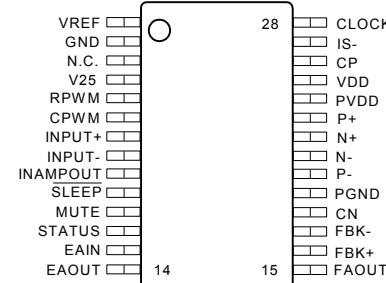

**DB PACKAGE**

THERMAL RESISTANCE-JUNCTION TO AMBIENT,  $\theta_{JA}$  | 50°C/W

Junction Temperature Calculation:  $T_J = T_A + (P_D \times \theta_{JA})$ .

The  $\theta_{JA}$  numbers are guidelines for the thermal performance of the device/pc-board system. All of the above assume no ambient airflow.

## PACKAGE PIN OUT

## DESCRIPTION (CONTINUED)

The mono output controller is available in either an LX1711 high power version (>50Wrms, 4Ω) with a supply voltage range of 7V-25V or an LX1710 high fidelity version (better SNR performance) with a supply voltage range of 7V-15V. The current rating of the external MOSFET's, the available supply voltage, and speaker load primarily limits the maximum output power. The amplifier provides high fidelity performance and it designed to operate over the full 20Hz to 20kHz audio band. Signal distortion measurements yield THD+N levels less than 0.05%

(1kHz, 1Wrms). Efficiency is greater than 80% typical, which eliminates the need for heatsinks, even at maximum output power.

The AudioMAX™ solution requires a single supply voltage, simplifying input power requirements where a dual supply may not be available. To minimize potential environmental noise issues and ease the integration of the amplifier into a variety of applications, features such as a balanced/differential audio input and a high power supply rejection ratio help reduce the effects of noise from the audio signal or power supply.

## FUNCTIONAL PIN DESCRIPTION

| Pin Name        | Description                            | Pin Name     | Description                               |
|-----------------|--|--------------|---|
| <b>VREF</b>     | 5V Reference                           | <b>FAOUT</b> | Feedback Amplifier Output                 |
| <b>GND</b>      | Low Current Ground                     | <b>FBK+</b>  | Feedback Amplifier Non-Inverting Input    |
| <b>N.C.</b>     | No Connect                             | <b>FBK-</b>  | Feedback Amplifier Inverting Input        |
| <b>V25</b>      | 2.5V Reference                         | <b>CN</b>    | Supply Decoupling for NFET Drivers        |
| <b>RPWM</b>     | PWM Resistor Connection                | <b>PGND</b>  | Output Driver High Current Ground         |
| <b>CPWM</b>     | PWM Capacitor Connection               | <b>P-</b>    | Drive for PFET on Negative Half of Bridge |
| <b>INPUT+</b>   | Positive Audio Input                   | <b>N-</b>    | Drive for NFET on Negative Half of Bridge |
| <b>INPUT -</b>  | Negative Audio Input                   | <b>N+</b>    | Drive for NFET on Positive Half of Bridge |

Figure 1 - LX1710 Block Diagram

**APPLICATION INFORMATION**
**Frequency Synchronization**

Two or more LX1710 / LX1711 oscillators can be configured for synchronous operation. One unit, the master, is programmed for the desired frequency with the  $R_{PWM}$  and  $C_{PWM}$  as usual. Additional units will be slave units, and their oscillators will be disabled by leaving the  $R_{PWM}$  pin disconnected. The CLOCK pin and the  $C_{PWM}$  pin of the slave units should be tied to the CLOCK pin and the  $C_{PWM}$  pin of the master unit respectively. In this configuration, the CLOCK pins of the slave units begin receiving instead of transmitting clock pulses. Also, the  $C_{PWM}$  pins quit driving the PWM capacitor in the slave units. Note that for optimum performance, all slave units should be located within a few inches of the master unit.

**Oscillator Configuration ( $R_{PWM}$  and  $C_{PWM}$  selection)**

The oscillator is programmed by the external timing components  $R_{PWM}$  and  $C_{PWM}$ . For a nominal frequency of 333kHz,  $R_{PWM}$  and  $C_{PWM}$  should be set to 49.9kOhms and 100pF respectively. Note that in order to keep the slope of the PWM ramp voltage proportional to the supply voltage, both the ramp peak and valley voltages, and the charge and discharge currents are proportional to the supply voltage. This keeps the frequency relatively constant while keeping the slope of the PWM ramp proportional to the voltage on the VDD pin. For operating frequencies other than 333kHz, the frequency can be approximated by the following equation:

$$\text{Frequency} = \frac{1}{(0.577)(R_{PWM})(C_{PWM}) + 320\text{ns}}$$

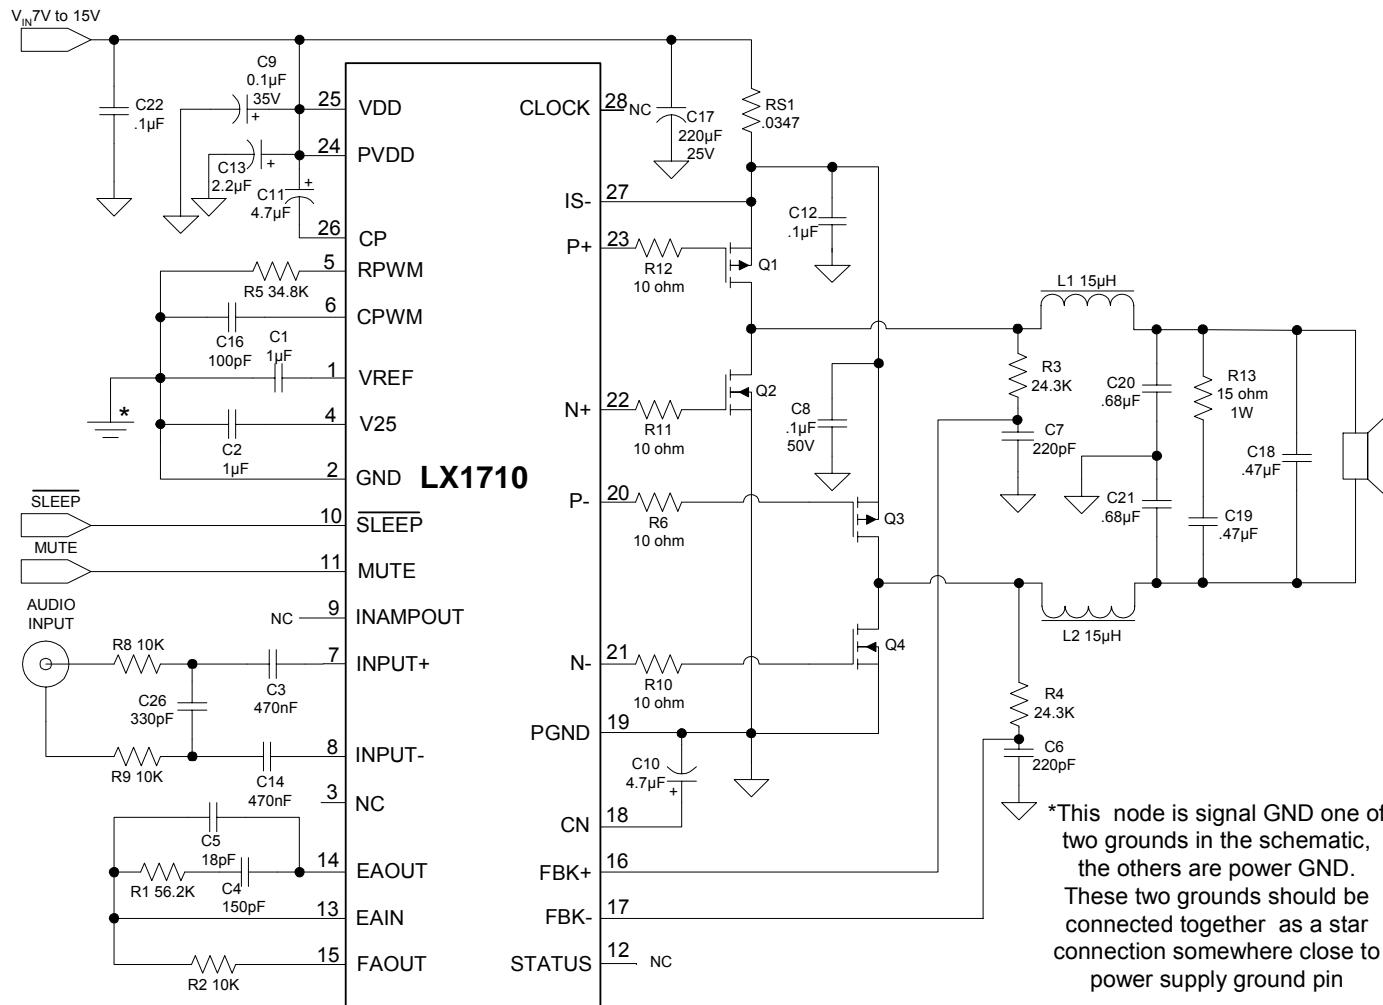

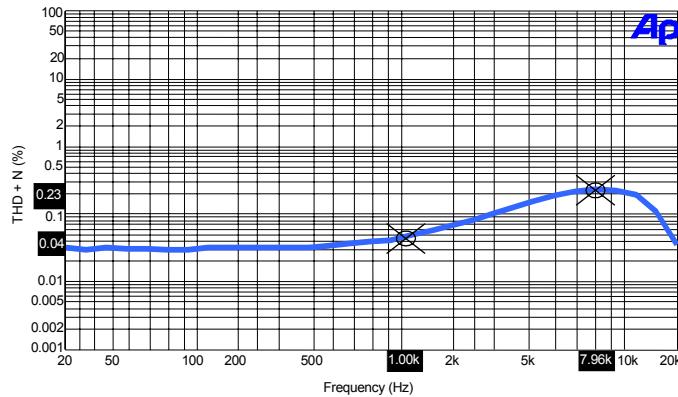

**TYPICAL APPLICATION**

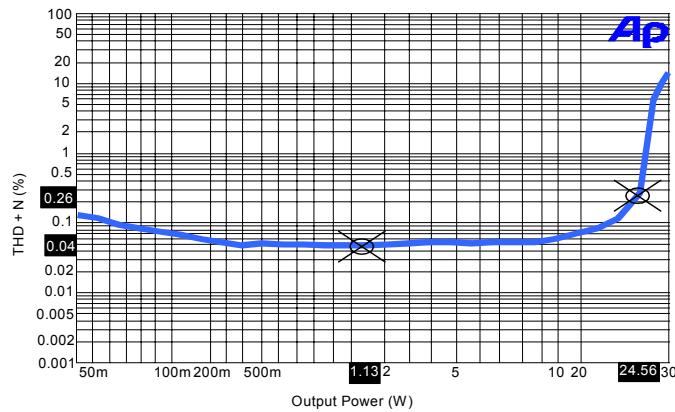

Figure 2 – Typical Class-D Switching Amplifier Circuit Application

THD+N VS. FREQUENCY

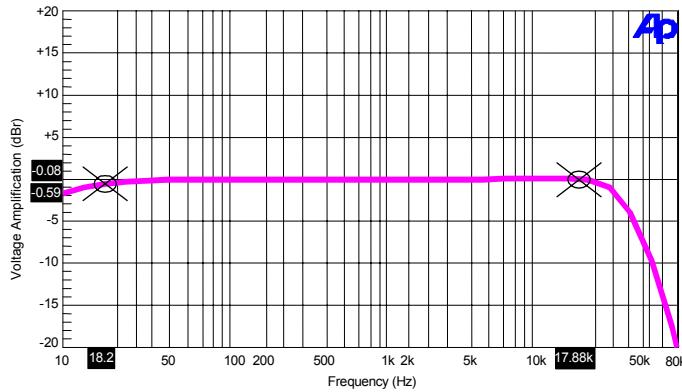

$V_{IN} = 15V$   
 $R_L = 4\Omega$   
 $P_O = 1W_{RMS}$

THD+N VS. OUTPUT POWER

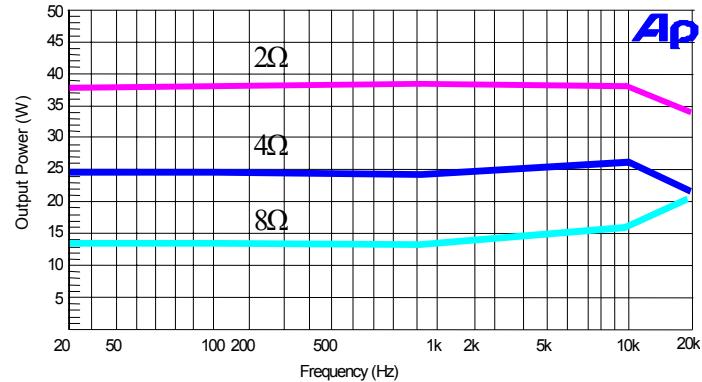

$V_{IN} = 15V$   
 $f_{IN} = 1\text{ kHz}$   
 $R_L = 4\Omega$

FREQUENCY RESPONSE

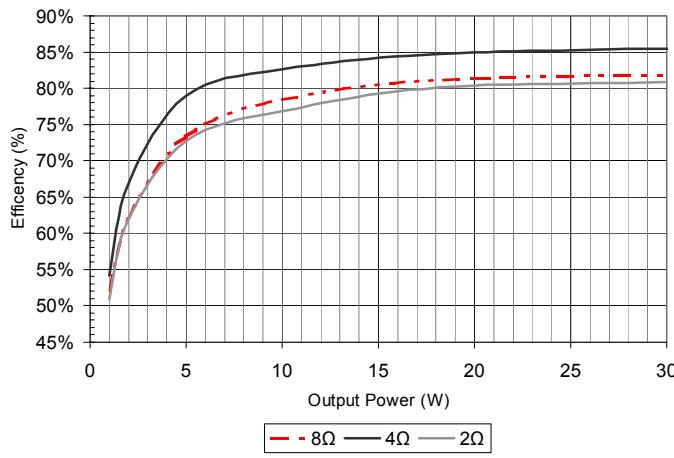

$V_{IN} = 15V$   
 $R_L = 4\Omega$   
 $P_O = 1W_{RMS}$

POWER BAND

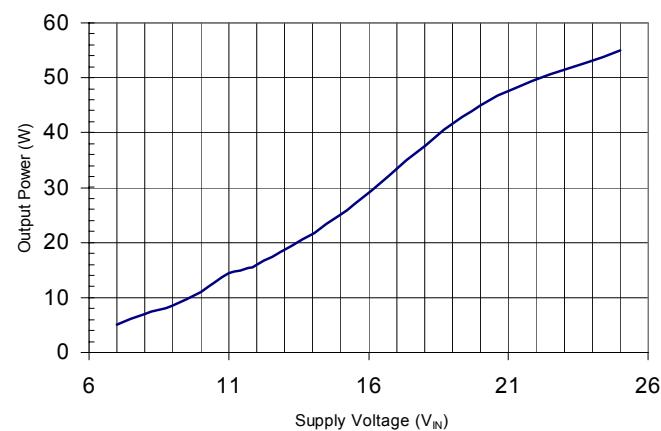

$V_{IN} = 15V$   
 $THD+N = 1\%$

#### EFFICIENCY VS. OUTPUT POWER

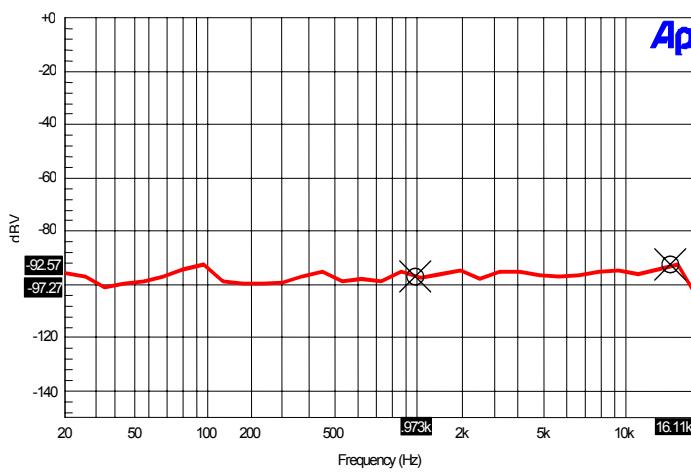

$V_{IN} = 15V$   
 $f_{IN} = 1kHz$

#### OUTPUT POWER VS. SUPPLY VOLTAGE

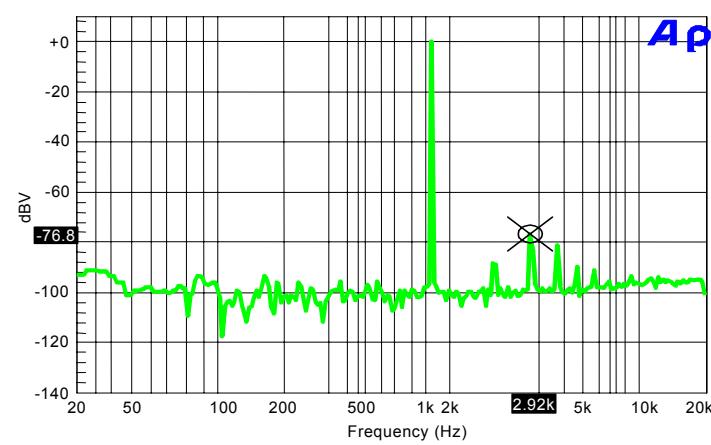

$f_{IN} = 1kHz$   
 $R_L = 4\Omega$   
 $THD+N = 1\%$

#### NOISE FLOOR FFT

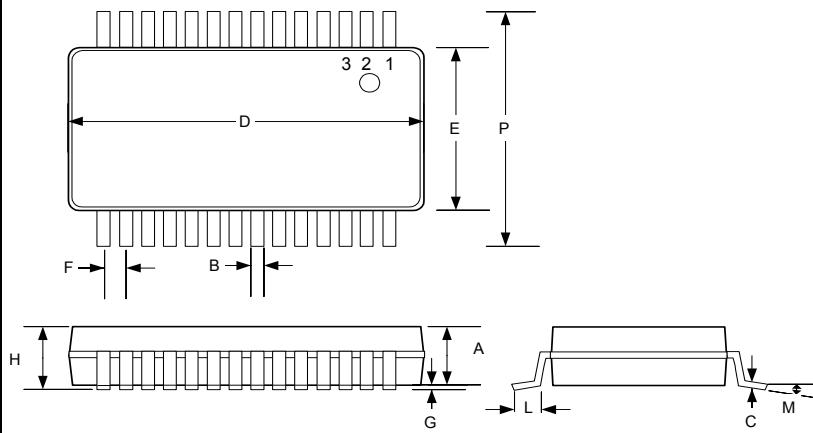

$V_{IN} = 15V$   
 $R_L = 4\Omega$   
10Hz – 22 kHz Bandwidth  
A - weighted

#### OUTPUT SPECTRUM

$V_{IN} = 15V$   
 $R_L = 4\Omega$   
 $f_{IN} = 1kHz$   
 $P_O = 1W_{RMS}$   
 $SNR = 81\text{ dBr}$   
10Hz – 22kHz Bandwidth  
A - weighted

**MECHANICAL DIMINENSIONS**
