

# SAI Series

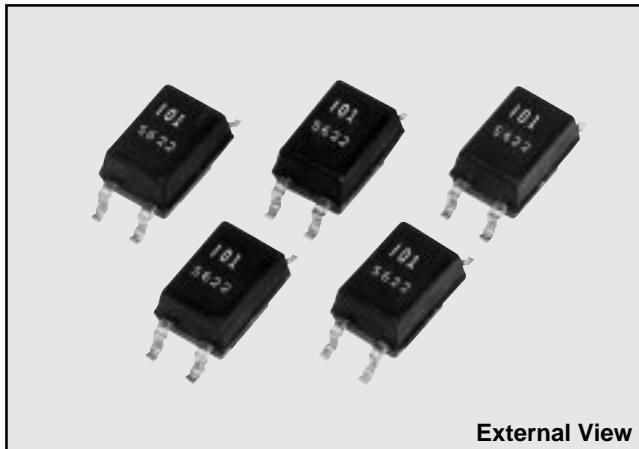

Switching Type — Surface-mount and Separate Excitation Type

## Features

- Surface-mount package with high output and efficiency
- Requires only 4 external components
- Phase correction and output voltage adjustment performed internally
- Built-in reference oscillator (60 kHz)
- Built-in overcurrent and thermal protection circuits

## Applications

- For power supplies in telephone sets
- For power supplies in office equipment

External View

## ■ Lineup

Type No.	Vo (V)	Io (A)
SAI01	5	0.5
SAI02	3.3	
SAI03	12	
SAI04	15	0.4
SAI05	13	
SAI06	9	

## ■ Absolute Maximum Ratings

Parameter	Symbol	Ratings		Unit
DC Input Voltage	V <sub>IN</sub>	35		V
Power Dissipation	P <sub>D</sub>	0.75		W
Junction Temperature	T <sub>j</sub>	+125		°C
Storage Temperature	T <sub>stg</sub>	-40 to +125		°C
SW Terminal Applied Reverse Voltage	V <sub>sw</sub>	-1		V
Thermal Resistance* (junction-to-case)	R <sub>th(j-c)</sub>	20		°C/W

\* Refer to Outline Drawing for the case temperature measuring points.

## ■ Recommended Operating Conditions

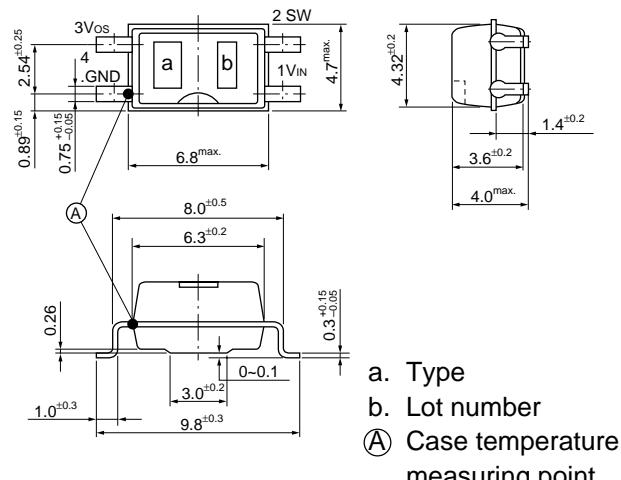

Parameter	Symbol	Ratings						Unit
		SAI01	SAI02	SAI03	SAI04	SAI05	SAI06	
DC Input Voltage Range	V <sub>IN</sub>	7 to 33	5.3 to 33	15 to 33	18 to 33	16 to 33	12 to 33	V
Output Current Range	I <sub>o</sub>	0 to 0.5		0 to 0.4				A
Operating Junction Temperature Range	T <sub>jop</sub>			-30 to +125				°C

## ■ Outline Drawing (unit:mm)

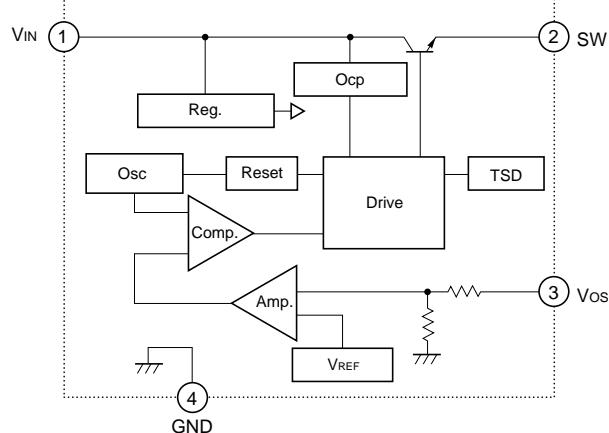

Plastic Mold Package Type  
Flammability: UL94V-0

Weight: Approx. 0.22 g

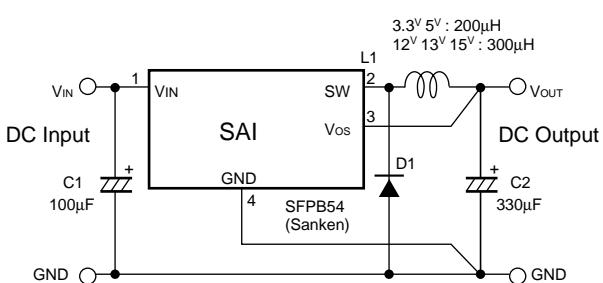

## Terminal Connections

- (1) Input
- (2) Switching output
- (3) Output Voltage Detection
- (4) Ground

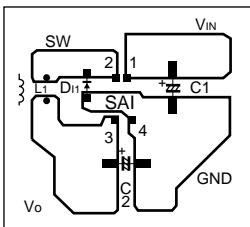

## ■ Block Diagram

## ■ Standard External Circuit

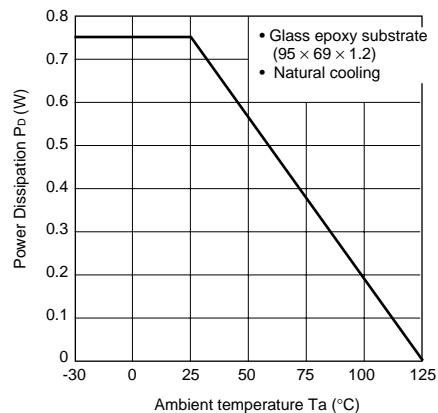

## ■ Example of Printed-circuit board

- a) For optimum operation, there must be only one GND line originating from terminal 4 and each component must be connected with the shortest possible wiring.
- b) To prevent heating of the IC, it is best to make the GND pattern larger since the internal frame and terminal 4 (GND) are connected to each other.

## ■ Ta-PD Characteristics

$$P_d = V_o \cdot I_o \left( \frac{100}{\eta_x} - 1 \right) - V_F \cdot I_o \left( 1 - \frac{V_o}{V_{IN}} \right)$$

The efficiency depends on the input voltage and the output current. Thus, obtain the value from the efficiency graph on page 8 and substitute the percentage in the formula above.

- Vo : Output voltage
- Io : Output current
- $\eta_x$  : Efficiency (%)
- V<sub>F</sub> : Diode forward voltage  
SFPB54-0.3V

Thermal design for D<sub>1</sub> must be performed separately.

## ■ Selecting external components

### 1. Inductor L1

- ① It must be suited for switching regulators.  
Do not use inductors for noise filters as they generate excessive heat.
- ② It must have the appropriate inductance value.  
If the inductance is too small (150μH or lower), abnormal oscillation may occur causing operation problems in the overcurrent protection circuit within the rated current range.
- ③ The rated current must be satisfied.  
If the rated current is exceeded, magnetic saturation leads to overcurrent.

### 2. Capacitors C1 and C2

- ① They must satisfy the breakdown voltage and allowable ripple current.  
Use of these capacitors over their derating values shortens their service lives and may also cause abnormal oscillation of the IC.
- ② C<sub>2</sub> must be a low-impedance type capacitor.  
A low-impedance type capacitor is recommended for C<sub>2</sub> to ensure minimum ripple voltage and stable switching operation.

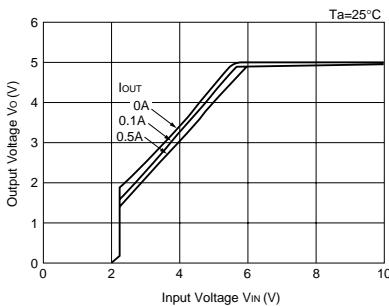

### 3. Diode D1

The Sanken SFPB54 diode is recommended for D<sub>1</sub>. If you intend to use an equivalent diode, be sure to make use of a Schottky barrier diode and make sure that the reverse voltage applied to terminal 2 of the IC does not exceed the value (-1V) given in the absolute maximum ratings. If you use a fast recovery diode or any other diode, application of a reverse voltage generated from the recovery or ON voltage of the diode may damage the IC.
