

FEATURES

- Low Operating Voltage $\pm 5V$ to $\pm 15V$
- **Supply Current: 500 μA**
- **Zero Supply Current When Shut Down**
- **Outputs Can Be Driven $\pm 30V$**
- Output "Open" When Off (Three-State)
- Output Drive: 10mA
- Pinout Similar to 1488*
- Output of Several Devices Can Be Paralleled

APPLICATIONS

- RS232 Driver
- Micropower Interface
- Level Translator

DESCRIPTION

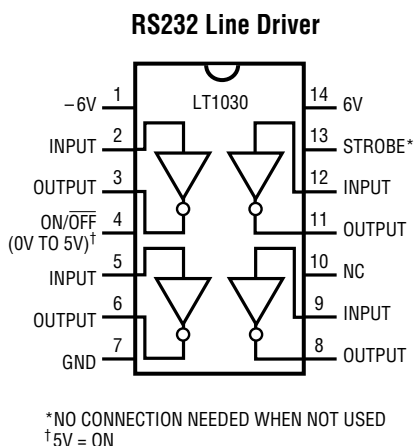

The LT[®]1030 is an RS232 line driver that operates over a $\pm 5V$ to $\pm 15V$ range on low supply current and can be shut down to zero supply current. Outputs are fully protected from externally applied voltages of $\pm 30V$ by current limiting. Since the output swings to within 200mV of the positive supply and 1V of the negative supply, power supply needs are minimized.

A major advantage of the LT1030 is the high impedance output state when off or powered down, which allows several different drivers on the same bus.

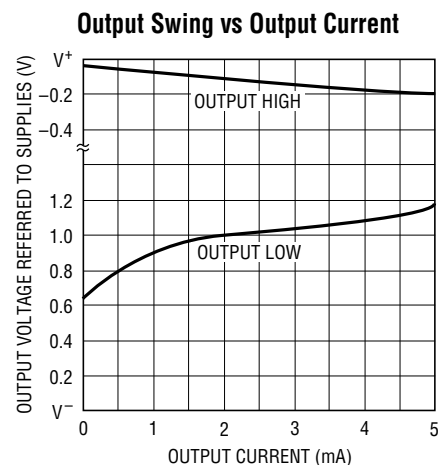

Our RS232 product line includes other high performance devices. The LT1039 is a triple low power driver/receiver with shutdown that can be powered from a 5V supply. The LT1080 is a 5V powered dual driver/receiver with on-chip $\pm 9V$ power generator and shutdown.

The ● denotes specifications which apply over the full operating temperature range.

Note 1: 3V applied to the Strobe pin will force all outputs low. Strobe pin input impedance is about 2k to ground. Leave open when not used.

PIN FUNCTIONS

V^- (Pin 1): Operates $-15V$ to $-2V$.

LOGIC INPUT (Pins 2, 5, 9, 12): Operate properly on TTL or CMOS levels. Output valid from $(V^- + 2V) \leq V_{IN} \leq 15V$. Connect to 5V when not used.

OUTPUT (Pins 3, 6, 8, 11): Line drive outputs.

ON/OFF (Pin 4): Shuts down entire circuit. Cannot be left open. For "normally on" operation, connect between 5V to 10V.

GND (Pin 7): Ground must be more positive than V^- .

STROBE (Pin 13): Forces all outputs low. Drive with 3V.

V^+ (Pin 14): Positive supply 5V to 15V.

Note: As with other bipolar ICs, forward biasing the substrate diode can cause problems. The LT1030 will draw high current from V^+ to ground if the V^- pin is open circuited or pulled above ground. If this is possible, connecting a diode from V^- to ground will prevent the high current state. Any low cost diode can be used.
