C MOS IC

GRAPHIC EQUALIZER VOLUME CONTROLLER  
FOR HOME STEREO, MUSIC CENTER USE

The 3-chip configuration consisting of the LC7520, a controller (LC7060 or general-purpose microcomputer LC6502), and a display LSI (LC7560 LCD, LC7565 FLT, LED) provides an electronic graphic equalizer system having the following features.

#### Functions

- On-chip electronic volume control for graphic equalizer with 7 bands each of right/left.
- 2dB/step variable in each band.
- Maximum boost of +10dB, maximum cut of -10dB, and 11 positions in each band.
- Setting can be made separately for right/left band.
- Band setting is made by serial data input. There are 2 control lines.
- Wide dynamic range.
- CMOS LSI of 40V breakdown voltage.

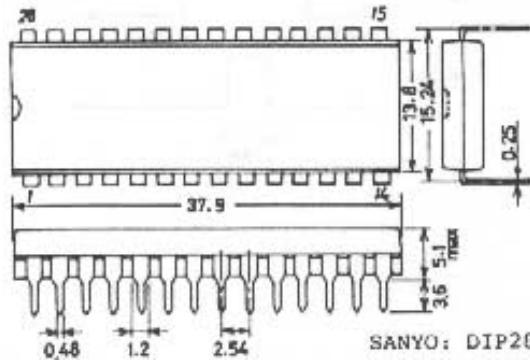

#### Features

- The gain in each band can be increased/decreased with one touch.
- Since the preset memory contents can be called with one touch, your desired frequency characteristic to the music can be selected.  
(Example) User option 2 modes + Maker option 3 modes + Last channel memory
- '0dB in each band (flat function)', 'The frequency characteristic in each band is reversed with respect to 0dB (reverse function).' - These functions can be software-controlled with one touch.
- Spectrum analyzing display facilitates recording equalization.
- Since 2 control lines can be also used for a display LSI, wiring between microcomputer and LSI is facilitated.
