## 64-bit TTL bipolar RAM, non-inverting (3-State)

74F219A

## FEATURES

- High speed performance
- Replaces 74F219
- Address access time: 8ns max vs 28ns for 74F219
- Power dissipation: 4.3mW/bit typ
- Schottky clamp TTL
- One chip enable
- Non-Inverting outputs (for inverting outputs see 74F189A)
- 3-state outputs
- 74F219A in 150 mil wide SO is preferred options for new designs
- C3F219A in 300 mil wide SOL replaces 74F219 in existing designs

## DESCRIPTION

The 74F219A is a high speed, 64-bit RAM organized as a 16-word by 4-bit array. Address inputs are buffered to minimize loading and are fully decoded on chip. The outputs are in high impedance state whenever the chip enable ( $\overline{CE}$ ) is high. The outputs are active only in the READ mode ( $\overline{WE}$  = high) and the output data is the complement of the stored data.

## APPLICATIONS

- Scratch pad memory
- Buffer memory
- Push down stacks
- Control store

**NOTES:**

- For conditions shown as MIN or MAX, use the appropriate value specified under recommended operating conditions for the applicable type.
- All typical values are at V<sub>CC</sub> = 5V, T<sub>amb</sub> = 25°C.
- Not more than one output should be shorted at a time. For testing I<sub>OS</sub>, the use of high-speed test apparatus and/or sample-and-hold techniques are preferable in order to minimize internal heating and more accurately reflect operational values. Otherwise, prolonged shorting of a high output may raise the chip temperature well above normal and thereby cause invalid readings in other parameter tests. In any sequence of parameter tests, I<sub>OS</sub> tests should be performed last.
