

HT23C040 CMOS 512K×8-Bit Mask ROM

Features

- Operating voltage: 2.7V~5.5V
- Low power consumption

 Operation: 25mA max. (V_{CC}=5V) 10mA max. (V_{CC}=3V)
 - Standby: 30μA max. (V_{CC}=5V) 10μA max. (V_{CC}=3V)
- Access time: 120ns max. (V_{CC} =5V) 250ns max. (V_{CC} =3V)

General Description

The HT23C040 is a read-only memory with high performance CMOS storage device whose 4096K of memory is arranged into 524288 word by 8 bits.

For application flexibility, the chip enable and output enable control pins can be selected as active high or active low. This flexibility not only allows easy interface with most microprocessors, but also eliminates bus contention in mul-

- 524288×8-bit of mask ROM
- Mask option: chip enable CE/ $\overline{\rm CE}/\rm OE1/\overline{\rm OE1},$ and output enable OE/ $\overline{\rm OE}/\rm NC$
- TTL compatible inputs and outputs
- Tristate outputs

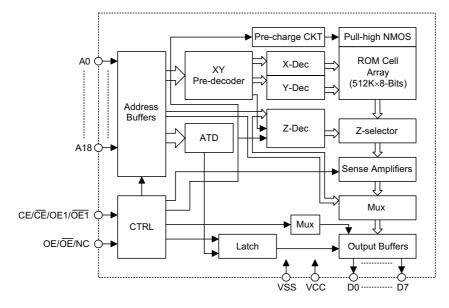

1

- Fully static operation
- Package type: 32-pin DIP/SOP

tiple bus microprocessor systems. An additional feature of the HT23C040 is its ability to enter the standby mode whenever the chip enable (CE/ \overline{CE}) is inactive, thus reducing current consumption to below $30\mu A$. The combination of these functions makes the chip suitable for high density low power memory applications.

Output load: see figure right Input rise and fall time: 10ns

Input pulse levels: 0.4V to 2.4V

Input and output timing reference levels: 0.8V and 2.0V (V_{CC}=5V) 1.5V (V_{CC}=3V)

Functional Description

The HT23C040 has two modes, namely data read mode and standby mode, controlled by CE/CE/OE1/OE1 and OE/OE/NC inputs.

• Standby mode

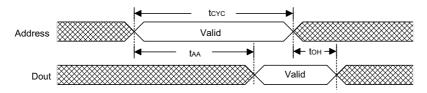

The HT23C040 has lower current consumption, controlled by the chip enable input (CE/ \overline{CE}). When a low/high level is applied to the CE/ \overline{CE} input regardless of the output enable (OE/ \overline{OE} /NC) states, the chip will enter the standby mode.

• Data read mode

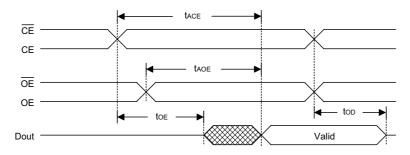

When both the chip enable $(\underline{CE}/\underline{OE1}/\overline{OE1})$ and the output enable $(\underline{OE}/\overline{OE}/NC)$ are active, the chip is in data read mode. Otherwise, active CE/CE and inactive OE/OE/NC result in deselect mode. The output will remain in Hi-Z state.

Timing Diagrams

• Propagation delay due to address (CE/ $\overline{\text{CE}}/\text{OE1}/\overline{\text{OE1}}$ and OE/ $\overline{\text{OE}}$ are active)

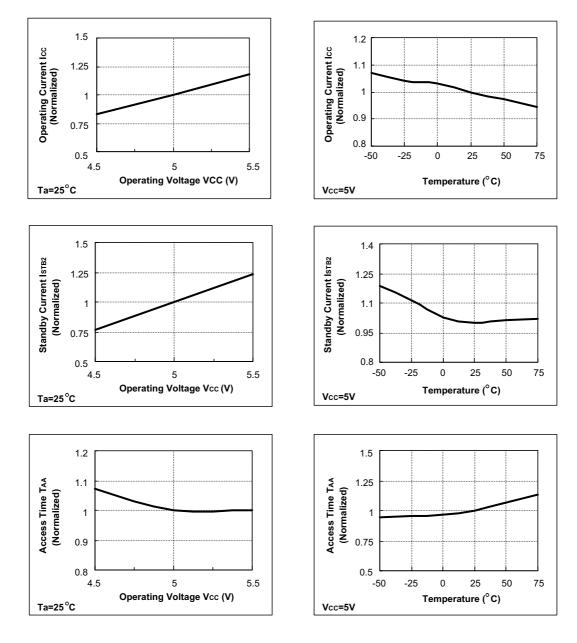

• Propagation delay due to chip and output enable (address valid)
