## 8-bit Proprietary Microcontroller

## CMOS

## F²MC-8L MB89180 Series

## MB89181/182/183/P185/PV180

## DESCRIPTION

The MB89180 series has been developed as a general-purpose version of the $\mathrm{F}^{2} \mathrm{MC}^{*}-8 \mathrm{~L}$ family consisting of proprietary 8 -bit, single-chip microcontrollers.

In addition to a compact instruction set, the microcontrollers contain a variety of peripheral functions such as dual-clock control system, five operating speed control stages, timers, a serial interface, a remote control transmission output, external interrupts, an LCD controller/driver, and a watch prescaler.
*: F²MC stands for FUJITSU Flexible Microcontroller.

## ■ FEATURES

- F²MC-8L family CPU core
- Dual-clock control system
- High speed operation at low voltage
- Minimum execution time: $0.95 \mu \mathrm{~s} / 2.7 \mathrm{~V}, 1.33 \mu \mathrm{~s} / 2.2 \mathrm{~V}$
- I/O ports: max. 64 channels
- 21-bit time-base timer
- $8 / 16$-bit timer/counter: 1 channel ( 8 bits $\times 2$ channels)
- 8-bit serial I/O: 1 channel
- LCD controller/driver: max. 32 segments outputs $\times 4$ commons
(Continued)

## PACKAGE

| 64-pin Plastic QFP | 64-pin Plastic QFP | 64-pin Plastic SQFP | 64-pin Ceramic MQFP |
| :--- | :--- | :--- | :--- |
| (FPT-64P-M06) | (FPT-64P-M09) | (FPT-64P-M03) | (MQP-64C-P01) |

(Continued)

- Remote control transmission output
- Buzzer output
- Watch prescaler ( 15 bits)
- External interrupts (wake-up function)

Four independent channels with edge detection function plus eight "L" level-interrupt channels

## ■ PRODUCT LINEUP

■ DIFFERENCES AMONG PRODUCTS

## 1. Memory Size

Before evaluating using the piggyback product, verify its differences from the product that will actually be used.
Take particular care on the following points:

- On the MB89181, addresses 0140н and later of the register bank cannot be used. On the MB89182, MB89183, and MB89P185 microcontrollers, addresses 0180н and later of the register bank cannot be used.
- On the MB89P185, addresses BFF0н to BFF5 н comprise the option setting area, option settings can be read by reading these addresses.
- The stack area, etc., is set at the upper limit of the RAM.

## 2. Current Consumption

- In the case of the MB89PV180, add the current consumed by the EPROM which is connected to the top socket.
- When operated at low speed, the product with an OTPROM (one-time PROM) or an EPROM will consume more current than the product with a mask ROM.

However, the current consumption in sleep/stop modes is the same. (For more information, see section "■ Electrical Characteristics.")

## 3. Mask Options

Functions that can be selected as options and how to designate these options vary by the product.
Before using options check section "■ Mask Options."
Take particular care on the following point:

- Options are fixed on the MB89PV180 except the segment output selection.

## PIN ASSIGNMENT

## MB89180 Series

## I/O CIRCUIT TYPE

| Type | Circuit | Remarks |
| :---: | :---: | :---: |
| A |  | - Crystal or ceramic oscillation type (main clock) At an oscillation feedback resistor of approximately $1 \mathrm{M} \Omega / 5.0 \mathrm{~V}$ |
|  |  | - CR oscillation type (main clock) (Selectable only for the MB89181/182/183) |
| B |  | - Crystal or ceramic oscillation type (subclock) <br> - At an oscillation feedback resistor of approximately 4.5 M $\Omega / 5.0 \mathrm{~V}$ |
| C | $\square \square-$ |  |
| D |  | - Output pull-up resistor <br> - P-ch of approximately $50 \mathrm{~K} \Omega / 5.0 \mathrm{~V}$ <br> - Hysteresis input |
| E |  | - CMOS I/O <br> The resource is a hysteresis input type. <br> - Pull-up resistor optional (MB89181/182/183/P185) |
| F |  | - CMOS I/O <br> - Pull-up resistor optional (MB89181/182/183/P185) |

(Continued)

| Type | Circuit | Remarks |
| :---: | :---: | :---: |
| G |  | - CMOS output <br> - The P-ch output is a heavy-current drive type. |
| H |  | - N-ch open-drain I/O <br> - CMOS input <br> - The resource is a hysteresis input type. <br> - Pull-up resistor optional (MB89181/182/183) |
| I |  | - N-ch open-drain I/O <br> - CMOS input <br> - P21, P26, and P27 are a heavy-current drive type. <br> - Pull-up resistor optional (MB89181/182/183) |
| J |  | - N-ch open-drain output <br> - Pull-up resistor optional (MB89181/182/183) |
| K |  | - LCD controller/driver segment output |
| L |  | - N-ch open-drain output <br> - Common output |

## MB89180 Series

## HANDLING DEVICES

## 1. Preventing Latchup

Latchup may occur on CMOS ICs if voltage higher than $\mathrm{V}_{\mathrm{cc}}$ or lower than $\mathrm{V}_{\mathrm{ss}}$ is applied to input and output pins other than medium- to high-voltage pins or if higher than the voltage which shows on "1. Absolute Maximum Ratings" in section "■ Electrical Characteristics" is applied between $V_{c c}$ and $V_{s s}$.

When latchup occurs, power supply current increases rapidly and might thermally damage elements. When using, take great care not to exceed the absolute maximum ratings.

Also, take care to prevent the analog power supply ( AV cc and AVR ) and analog input from exceeding the digital power supply ( $\mathrm{V} c \mathrm{c}$ ) when the analog system power supply is turned on and off.

## 2. Treatment of Unused Input Pins

Leaving unused input pins open could cause malfunctions. They should be connected to a pull-up or pull-down resistor.

## 3. Treatment of Power Supply Pins on Microcontrollers with $A / D$ and $D / A$ Converters

Connect to be $A V c c=D A V C=V_{c c}$ and $A V s s=A V R=V_{s s}$ even if the $A / D$ and $D / A$ converters are not in use.

## 4. Treatment of N.C. Pins

Be sure to leave (internally connected) N.C. pins open.

## 5. Power Supply Voltage Fluctuations

Although $\mathrm{V}_{c c}$ power supply voltage is assured to operate within the rated range, a rapid fluctuation of the voltage could cause malfunctions, even if it occurs within the rated range. Stabilizing voltage supplied to the IC is therefore important. As stabilization guidelines, it is recommended to control power so that Vcc ripple fluctuations (P-P value) will be less than $10 \%$ of the standard Vcc value at the commercial frequency ( 50 to 60 Hz ) and the transient fluctuation rate will be less than $0.1 \mathrm{~V} / \mathrm{ms}$ at the time of a momentary fluctuation such as when power is switched.

## 6. Precautions when Using an External Clock

Even when an external clock is used, oscillation stabilization time is required for power-on reset (optional) and wake-up from stop mode.

## PROGRAMMING TO THE EPROM ON THE MB89P875

The MB89P185 is an OTPROM version of the MB89180 series.

## 1. Features

- 16-Kbyte PROM on chip
- Options can be set using the EPROM programmer.
- Equivalency to the MBM27C256A in EPROM mode (when programmed with the EPROM programmer)

## 2. Memory Space

Memory space in the EPROM mode is diagrammed below.

## MB89180 Series

## 3. Programming to the EPROM

In EPROM mode, the MB89P185 functions equivalent to the MBM27C256A. This allows the PROM to be programmed with a general-purpose EPROM programmer (the electronic signature mode cannot be used) by using the dedicated socket adapter.

## - Programming procedure

(1) Set the EPROM programmer to the MBM27C256A.
(2) Load program data into the EPROM programmer at 4000н to 7 FFFH (note that addresses $\mathrm{COOOH}_{\mathrm{H}}$ to $\operatorname{FFFF}$ н in operating mode assign to 4000 н to 7 FFFн in EPROM mode).
Program to 4000 н to 7 FFFH with the EPROM programmer.
(3) Load option data into addresses 3 FFOH to 3 FF5 $\boldsymbol{H}$ of the EPROM programmer. (For information about each corresponding option, see "7. PROM Option Bit Map.")
Program to 3 FFOH to 3 FF5 н with the EPROM programmer.

## 4. Recommended Screening Conditions

High-temperature aging is recommended as the pre-assembly screening procedure for a product with a blanked OTPROM microcomputer program.

## 5. Programming Yield

All bits cannot be programmed at Fujitsu shipping test to a blanked OTPROM microcomputer, due to its nature. For this reason, a programming yield of $100 \%$ cannot be assured at all times.

## 6. EPROM Programmer Socket Adapter

| Package | Compatible socket adapter |
| :---: | :--- |
| FPT-64P-M09 | ROM-64QF2-28DP-8L2 |
| FPT-64P-M06 | ROM-64QF-28DP-8L3 |

Inquiry: Sun Hayato Co., Ltd.: TEL 81-3-3802-5760
Note: Depending on the EPROM programmer, inserting a capacitor of about $0.1 \mu \mathrm{~F}$ between $\mathrm{V}_{\text {pp }}$ and $\mathrm{V}_{\text {ss }}$ or $\mathrm{V}_{\mathrm{cc}}$ and Vss can stabilize programming operations.

## 7. PROM Option Bit Map

The programming procedure is the same as that for the PROM. Options can be set by programming values at the addresses shown on the memory map. The relationship between bits and options is shown on the following bit map:

|  | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## 3. Memory Space

Memory space in each mode is diagrammed below.

## 4. Programming to the EPROM

(1) Set the EPROM programmer to the MBM27C256A.
(2) Load program data into the EPROM programmer at 4000 н to 7 FFFн.
(3) Program to 4000 to 7 FFFн with the EPROM programmer.

## BLOCK DIAGRAM

## MB89180 Series

## CPU CORE

## 1. Memory Space

The microcontrollers of the MB89180 series offer a memory space of 64 Kbytes for storing all of I/O, data, and program areas. The I/O area is located at the lowest address. The data area is provided immediately above the I/O area. The data area can be divided into register, stack, and direct areas according to the application. The program area is located at exactly the opposite end, that is, near the highest address. Provide the tables of interrupt reset vectors and vector call instructions toward the highest address within the program area. The memory space of the MB89180 series is structured as illustrated below.

## Memory Space

## 2. Registers

The F${ }^{2}$ MC-8L family has two types of registers; dedicated registers in the CPU and general-purpose registers in the memory. The following dedicated registers are provided:

Program counter (PC): A 16-bit register for indicating instruction storage positions
Accumulator (A):
A 16-bit temporary register for storing arithmetic operations, etc. When the instruction is an 8 -bit data processing instruction, the lower byte is used.
Temporary accumulator (T): A 16-bit register which performs arithmetic operations with the accumulator When the instruction is an 8-bit data processing instruction, the lower byte is used.
Index register (IX): A 16-bit register for index modification
Extra pointer (EP):
A 16-bit pointer for indicating a memory address
Stack pointer (SP):
Program status (PS):
A 16-bit register for indicating a stack area
A 16-bit register for storing a register pointer, a condition code

| 16 bits |  | Initial value |
| :---: | :---: | :---: |
| PC | : Program counter | FFFD |
| A | : Accumulator | Undefined |
| T | : Temporary accumulator | Undefined |
| IX | : Index register | Undefined |
| EP | : Extra pointer | Undefined |
| SP | : Stack pointer | Undefined |
| PS | : Program status I-fla | = $0, \mathrm{LL} 1,0=$ |

The PS can further be divided into higher 8 bits for use as a register bank pointer (RP) and the lower 8 bits for use as a condition code register (CCR). (See the diagram below.)

## Structure of the Program Status Register

The RP indicates the address of the register bank currently in use. The relationship between the pointer contents and the actual address is based on the conversion rule illustrated below.

## Rule for Conversion of Actual Addresses of the General-purpose Register Area

The CCR consists of bits indicating the results of arithmetic operations and the contents of transfer data and bits for control of CPU operations at the time of an interrupt.

H-flag: Set when a carry or a borrow from bit 3 to bit 4 occurs as a result of an arithmetic operation. Cleared otherwise. This flag is for decimal adjustment instructions.

I-flag: Interrupt is allowed when this flag is set to 1 . Interrupt is prohibited when the flag is set to 0 . Set to 0 when reset.

IL1, 0: Indicates the level of the interrupt currently allowed. Processes an interrupt only if its request level is higher than the value indicated by this bit.

| IL1 | ILO | Interrupt level | High-Iow |
| :---: | :---: | :---: | :---: |
| 0 | 0 | 1 | High |
| 0 | 1 |  |  |
| 1 | 0 | 2 | Low $=$ no interrupt |
| 1 | 1 | 3 |  |

N-flag: Set if the MSB is set to 1 as the result of an arithmetic operation. Cleared when the bit is set to 0 .
Z-flag: Set when an arithmetic operation results in 0 . Cleared otherwise.
V-flag: Set if the complement on 2 overflows as a result of an arithmetic operation. Reset if the overflow does not occur.

C-flag: Set when a carry or a borrow from bit 7 occurs as a result of an arithmetic operation. Cleared otherwise. Set to the shift-out value in the case of a shift instruction.

The following general-purpose registers are provided:
General-purpose registers: An 8-bit register for storing data
The general-purpose registers are 8 bits and located in the register banks of the memory. One bank contains eight registers. Up to a total of 8 banks can be used on the MB89181 (RAM $128 \times 8$ bits) and a total of 16 banks can be used on the MB89182/183 (RAM $256 \times 8$ bits). The bank currently in use is indicated by the register bank pointer (RP).

Note: The number of register banks that can be used varies with the RAM size.

## Register Bank Configuration

## ELECTRICAL CHARACTERISTICS

## 1. Absolute Maximum Ratings

| Parameter | Symbol | Value |  | Unit | Remarks |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |
|  |  | Min. | Max. |  |  |
| Power supply voltage | Vcc | Vss -0.3 | Vss +7.0 | V |  |
| LCD power supply voltage | V1 to V3 | Vss - 0.3 | Vss +7.0 | V | V1 to V3 must not exceed Vcc. |
| Input voltage | $\mathrm{V}_{11}$ | Vss-0.3 | $\mathrm{Vcc}+0.3$ | V | $V_{11}$ must not exceed Vss +7.0 V . Except P20 to P27 without a pullup resistor |
|  | V12 | Vss - 0.3 | Vss +7.0 | V | P20 to P27 without a pull-up resistor |
| Output voltage | Vo1 | Vss-0.3 | $\mathrm{Vcc}+0.3$ | V | Vo1 must not exceed Vss +7.0 V . Except P20 to P27, P40 to P47, and P50 to P57 without a pull-up resistor |
|  | Vo2 | Vss - 0.3 | Vss +7.0 | V | P20 to P27, P40 to P47, and P50 to P57 without a pull-up resistor |
| "L" level output current | lob1 | - | 10 | mA | Except P21, P26, P27, and power supply pins |
|  | locz | - | 20 | mA | P21, P26, and P27 |
| "L" level average output current | lolav1 | - | 4 | mA | Average value (operating current $\times$ operating rate) Except P21, P26, P27, and power supply pins |
|  | lolav2 | - | 8 | mA | Average value (operating current $\times$ operating rate) P21, P26, and P27 |
| "L" level total output current | Elo | - | 80 | mA |  |
| "L" level total average output current | Elolav | - | 40 | mA | Average value (operating current $\times$ operating rate) |
| "H" level output current | IOH1 | - | -5 | mA | Except P30 and power supply pins |
|  | Іон2 | - | -10 | mA | P30 |

(Continued)
(Continued)

| Parameter | Symbol | Value |  | Unit | Remarks |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Min. | Max. |  |  |
| "H" level average output current | Iohav1 | - | -2 | mA | Average value (operating current $\times$ operating rate) Except P30 and power supply pins |
|  | lohav2 | - | -4 | mA | Average value (operating current $\times$ operating rate) P30 |
| "H" level total output current | Гloн | - | -20 | mA |  |
| "H" level total average output current | $\sum$ lohav | - | -10 | mA | Average value (operating current $\times$ operating rate) |
| Power consumption | PD | - | 300 | mW |  |
| Operating temperature | $\mathrm{T}_{\mathrm{A}}$ | -40 | +85 | ${ }^{\circ} \mathrm{C}$ |  |
| Storage temperature | Tstg | -55 | +150 | ${ }^{\circ} \mathrm{C}$ |  |

Precautions: Permanent device damage may occur if the above "Absolute Maximum Ratings" are exceeded.
Functional operation should be restricted to the conditions as detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## 2. Recommended Operating Conditions

| Parameter | Symbol | Value |  | Unit | Remarks |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Min. | Max. |  |  |
| Power supply voltage | Vcc | $2.2^{* 1}$ | 6.0 | V | Guaranteed normal operation range, applicable to the mask ROM products |
|  |  | $2.7{ }^{* 1}$ | 6.0 | V | MB89P185/PV180 |
|  |  | 1.5 | 6.0 | V | RAM data holding assurance range in stop mode |
| Power supply voltage for LCD | V1 to V3 | Vss | Vcc*2 | V | V1 to V3 pins |
| Operating temperature | $\mathrm{T}_{\mathrm{A}}$ | -40 | +85 | ${ }^{\circ} \mathrm{C}$ |  |

*1: The minimum operating power supply voltage varies with the operating frequency and execution time (instruction cycle).
*2: The liquid-crystal power supply range and optimum value vary depending on the characteristics of the liquidcrystal display element used.

## INSTRUCTIONS

Execution instructions can be divided into the following four groups:

- Transfer
- Arithmetic operation
- Branch
- Others

Table 1 lists symbols used for notation of instructions.
Table 1 Instruction Symbols

| Symbol |  |
| :---: | :--- |
| dir | Direct address (8 bits) |
| off | Offset (8 bits) |
| ext | Extended address (16 bits) |
| \#vct | Vector table number (3 bits) |
| \#d8 | Immediate data (8 bits) |
| \#d16 | Immediate data (16 bits) |
| dir: b | Bit direct address (8:3 bits) |
| rel | Branch relative address (8 bits) |
| @ | Register indirect (Example: @A, @IX, @EP) |
| A | Accumulator A (Whether its length is 8 or 16 bits is determined by the instruction in use.) |
| AH | Upper 8 bits of accumulator A (8 bits) |
| AL | Lower 8 bits of accumulator A (8 bits) |
| T | Temporary accumulator T (Whether its length is 8 or 16 bits is determined by the <br> instruction in use.) |
| TH | Upper 8 bits of temporary accumulator T (8 bits) |
| TL | Lower 8 bits of temporary accumulator T (8 bits) |
| IX | Index register IX (16 bits) |

(Continued)
(Continued)

| Symbol |  |
| :---: | :--- |
| EP | Extra pointer EP (16 bits) |
| PC | Program counter PC (16 bits) |
| SP | Stack pointer SP (16 bits) |
| PS | Program status PS (16 bits) |
| dr | Accumulator A or index register IX (16 bits) |
| CCR | Condition code register CCR (8 bits) |
| RP | Register bank pointer RP (5 bits) |
| Ri | General-purpose register Ri (8 bits, $\mathrm{i}=0$ to 7 ) |
| $\times$ | Indicates that the very $\times$ is the immediate data. <br> (Whether its length is 8 or 16 bits is determined by the instruction in use.) |
| $(\times)$ | Indicates that the contents of $\times$ is the target of accessing. <br> (Whether its length is 8 or 16 bits is determined by the instruction in use.) |
| $((\times))$ | The address indicated by the contents of $\times$ is the target of accessing. <br> (Whether its length is 8 or 16 bits is determined by the instruction in use.) |

Columns indicate the following:

| Mnemonic: | Assembler notation of an instruction |
| :--- | :--- |
| $\sim$ | Number of instructions |
| \#: | Number of bytes |

Operation: Operation of an instruction
TL, TH, AH: A content change when each of the TL, TH, and AH instructions is executed. Symbols in the column indicate the following:

- "-" indicates no change.
- dH is the 8 upper bits of operation description data.
- AL and AH must become the contents of AL and AH immediately before the instruction is executed.
- 00 becomes 00 .
$\mathrm{N}, \mathrm{Z}, \mathrm{V}, \mathrm{C}: \quad$ An instruction of which the corresponding flag will change. If + is written in this column, the relevant instruction will change its corresponding flag.

OP code: Code of an instruction. If an instruction is more than one code, it is written according to the following rule:

Example: 48 to $4 \mathrm{~F} \leftarrow$ This indicates $48,49, \ldots 4 \mathrm{~F}$.

Table 2 Transfer Instructions (48 instructions)

| Mnemonic | $\sim$ | \# | Operation | TL | TH | AH | NZVC | OP code |

| XCHW A,EP | 3 | 1 | (A) $\leftrightarrow(\mathrm{EP})$ | - | - | dH | ---- | F7 |
| XCHW A,IX | 3 | 1 | $(\mathrm{A}) \leftrightarrow(\mathrm{IX})$ | - | - | dH | ---- | F6 |
| XCHW A,SP | 3 | 1 | ( A$) \leftrightarrow(\mathrm{SP})$ | - | - | dH | ---- | F5 |
| MOVW A,PC | 2 | 1 | $(\mathrm{A}) \leftarrow(\mathrm{PC})$ | - | - | dH | ---- | F0 |

Notes: • During byte transfer to $A, T \leftarrow A$ is restricted to low bytes.

- Operands in more than one operand instruction must be stored in the order in which their mnemonics are written. (Reverse arrangement of $\mathrm{F}^{2} \mathrm{MC}-8$ family)

Table 3 Arithmetic Operation Instructions ( 62 instructions)

## All Rights Reserved.

The contents of this document are subject to change without notice. Customers are advised to consult with FUJITSU sales representatives before ordering.

The information and circuit diagrams in this document presented as examples of semiconductor device applications, and are not intended to be incorporated in devices for actual use. Also, FUJITSU is unable to assume responsibility for infringement of any patent rights or other rights of third parties arising from the use of this information or circuit diagrams.

FUJITSU semiconductor devices are intended for use in standard applications (computers, office automation and other office equipment, industrial, communications, and measurement equipment, personal or household devices, etc.).

## CAUTION:

Customers considering the use of our products in special applications where failure or abnormal operation may directly affect human lives or cause physical injury or property damage, or where extremely high levels of reliability are demanded (such as aerospace systems, atomic energy controls, sea floor repeaters, vehicle operating controls, medical devices for life support, etc.) are requested to consult with FUJITSU sales representatives before such use. The company will not be responsible for damages arising from such use without prior approval.

Any semiconductor devices have inherently a certain rate of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

If any products described in this document represent goods or technologies subject to certain restrictions on export under the Foreign Exchange and Foreign Trade Control Law of Japan, the prior authorization by Japanese government should be required for export of those products from Japan.
