Temperature Sensor Hub and Fan Controller

Preliminary Technical Data

ADT7470

FEATURES

- Monitors up to 10 remote temperature sensors
- Monitors and controls speed of up to 4 fans independently
- PWM outputs drive each fan under software control
- $\overline{\text{FULL\_SPEED}}$ input allows fans to be blasted 100% by external hardware
- $\overline{\text{SMBALERT}}$ interrupt signals failures to system controller
- Tristate ADDR pin allows up to 3 devices on a single bus
- Temperature decoder interprets TMP05/TMP06 temperature sensors and communicates values over I²C bus
- Limit comparison of all monitored values
- Supports fast I²C standard (400 kHz max)
- Meets SMBus 2.0 electrical specifications (fully SMBus 1.1 compliant)
- Footprint compatible with ADT7460

APPLICATIONS

- Servers
- Networking and telecommunications equipment
- Desktops

GENERAL DESCRIPTION

The ADT7470 controller is a multichannel temperature sensor and PWM fan controller and fan speed monitor for noise-sensitive systems requiring active system cooling. It is designed to interface directly to an I²C bus and control/monitor the fans using a service processor. The aim is to quickly develop systems that are modular and can easily be expanded depending on the system's cooling requirements. The device can monitor up to ten temperature sensors. It can also monitor and control the speed of four fans so that they operate at the lowest possible speed for minimum acoustic noise. A $\overline{\text{FULL\_SPEED}}$ input is provided to allow the fans to be "blasted" to 100% via external hardware control, under extreme thermal conditions or on system startup. An $\overline{\text{SMBALERT}}$ interrupt communicates error conditions such as fan underspeed, fan failure to the system service processor. Individual error conditions can then be read from status registers over the I²C bus. In the event of a fan failure condition, any or all PWM outputs can be programmed to automatically adjust to 100% to provide failsafe cooling.

[1] V_{DD} should never be floated in presence of SCL/SDA activity. Charge injection can be sufficient to induce approximately 0.6 V on V_{DD}.

Note the following about the specifications for the ADT7470:

- All voltages are measured with respect to GND, unless otherwise specified.
- Typical values are at T_A = 25°C and represent most likely parametric norm.
- Logic inputs accept input high voltages up to 5 V even when device is operating at supply voltages below 5 V.
- V_{DD} should never be floated in presence of SCL/SDA activity. Charge injection can be sufficient to induce approximately 0.6 V on V_{DD}.
- Timing specifications are tested at logic levels of V_{IL} = 0.8 V for a falling edge and V_{IH} = 2.0 V for a rising edge.

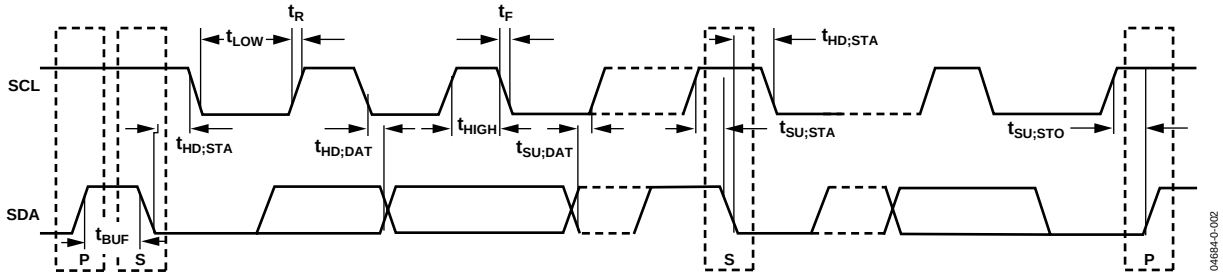

Figure 2. Diagram for Serial Bus Timing

ABSOLUTE MAXIMUM RATINGS

Table 2.

Parameter	Rating
Positive Supply Voltage (V_{CC})	6.5 V
Voltage on Any Tach or PWM pin	–0.3 V to 6.5 V
Voltage on Any Input or Output Pin	–0.3 V to V_{CC} + 0.3 V
Input Current at any Pin	±5 mA
Package Input Current	±20 mA
Maximum Junction Temperature (T_J max)	150°C
Storage Temperature Range	–65°C to +150°C
Lead Temperature, Soldering	
Vapor Phase, 60 sec	215°C
Infrared, 15 sec	200°C
ESD Rating	2000 V

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

THERMAL CHARACTERISTICS

16-Lead QSOP Package:
θ_{JA} = 105°C/Watt, θ_{JC} = 39°C/Watt

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although this product features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

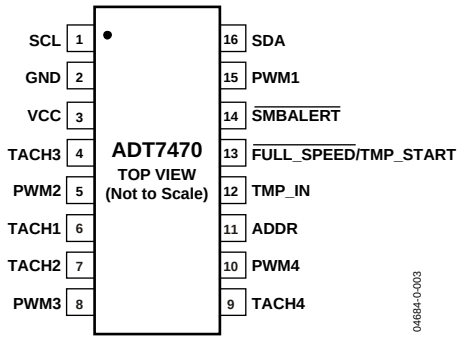

Figure 3. RQ-16

Table 3. Pin Function Descriptions

Pin No.	Mnemonic	Description
1	SCL	Digital Input (Open Drain). SMBus serial clock input. Requires SMBus pull-up.
2	GND	Ground pin for the ADT7470.
3	V_{CC}	Power Supply Pin. Can be powered by 3.3 V standby if operation in low power states is required.
4	TACH3	Digital Input (Open Drain). Fan tachometer input to measure speed of Fan 3.
5	PWM2	Digital I/O (Open Drain). Requires 10 kΩ typical pull-up. Pulse width modulated output to control Fan 2 speed. Can be configured as GPIO by setting Bit 0x7F[2] = 1.
6	TACH1	Digital Input (Open Drain). Fan tachometer input to measure speed of Fan 1.
7	TACH2	Digital Input (Open Drain). Fan tachometer input to measure speed of Fan 2.
8	PWM3	Digital I/O (Open Drain). Pulse width modulated output to control Fan 3 speed. Requires 10 kΩ typical pull-up. Can be configured as GPIO by setting Bit 0x7F[1] = 1
9	TACH4	Digital Input (Open Drain). Fan tachometer input to measure speed of Fan 4.
10	PWM4	Digital I/O (Open Drain). Pulse width modulated output to control Fan 4 speed. Requires 10 kΩ typical pull-up. Can be configured as GPIO by setting Bit 0x7F[0] = 1.
11	ADDR	Tristate Input. Used to set SMBus device address.
12	TMP_IN	Digital Input (Open Drain). PWM input to PWM processing engine that interprets daisy chained output from multiple TMP05 temperature sensors. Readings from individual TMP05 temperature sensors are available by reading the temperature reading registers over the SMBus.
13	$\overline{\text{FULL\_SPEED}}$	Digital Input—Active Low (Open Drain). This inputl blasts the fans to 100% when the pin is pulled low externally.
13	TMP_START	Digital Output (Open Drain). This pin can be used as an output to start daisy-chained temperature measurements from TMP05 or TMP06 temperature sensors.
14	$\overline{\text{SMBALERT}}$	Digital Output—Active Low (Open Drain). This pin may be reconfigured as an $\overline{\text{SMBALERT}}$ interrupt output to signal out-of-limit conditions such as fan failures.
15	PWM1	Digital I/O (Open Drain). Pulse width modulated output to control Fan 1 speed. Requires 10 kΩ typical pull-up. Can be configured as GPIO by setting Bit 0x7F[3] = 1.
16	SDA	Digital I/O (Open Drain). SMBus bidirectional serial data. Requires SMBus pull-up.

FUNCTIONAL DESCRIPTION

GENERAL DESCRIPTION

The ADT7470 is a multichannel PWM fan controller and monitor for any system requiring monitoring and cooling. The device communicates with the system via a serial system management bus. The device has a single address line for address selection (Pin 11), a serial data line for reading and writing addresses and data (Pin 16), and an input line for the serial clock (Pin 1). All control and programming functions of the ADT7470 are performed over the serial bus that supports both SMBus and fast I²C specifications. In addition, an SMBALERT interrupt output is provided to indicate out-of-limit conditions.

FAN SPEED MEASUREMENT

When the ADT7470 monitoring sequence is started, it cycles through each fan tach input to measure fan speed. Measured values from these inputs are stored in value registers. These can be read out over the serial bus, or can be compared with programmed limits stored in the limit registers. The results of out of limit comparisons are stored in the status registers, which can be read over the serial bus to flag out of limit conditions. If fan speeds drop below preset levels or a fan stalls, an interrupt is generated and the fans can automatically blast to 100%. Likewise, the ADT7470 has the ability to flag fan overspeed conditions using fan tach max registers.

ADT7470 ADDRESS SELECTION

Pin 11 is the address selection pin, ADDR. If Pin 11 is pulled low on power-up, the ADT7470 defaults to Slave Address 0x58 (left-justified) or 0x2C (right-justified). If Pin 11 is floating on power-up, then the ADT7470 defaults to SMBus slave Address 0x5A (left-justified) or 0x2D (right-justified). By pulling the pin high on power-up, the SMBus slave address is 0x5C (left-justified) or 0x2E (right-justified).

INTERNAL REGISTERS OF THE ADT7470

A brief description of the ADT7470's principal internal registers is given in the following sections. More detailed information on the function of each register is found in the register map in Table 21.

Configuration Registers

These registers provide control and configuration of the ADT7470, including alternate pinout functionality such as a fan blast input (FULL_SPEED) or daisy-chained TMP05 measurement (start) output.

Address Pointer Register

This register contains the address that selects one of the other internal registers. When writing to the ADT7470, the first byte of data is always a register address, which is written to the address pointer register.

Status Registers

These registers provide status of each limit comparison and are used to signal out-of-limit conditions on the fan speed channels, or temperature channels if monitored using the PWM_IN feature. If Pin 14 (SMBALERT) is used in the system, then this pin asserts low whenever a status bit gets set, signaling an out-of-limit condition.

Interrupt Mask Registers

Allows each interrupt status event to be individually masked from driving the SMBALERT output as required. This is useful where fan tach inputs is unused and left floating, or if temperature inputs from TMP05s are ignored from an interrupt perspective. Masking interrupt status bits prevents the SMBALERT output from being driven although the status bits still reflect out-of-limit conditions. This can prevent a service processor from being continually tied up in an interrupt service routine, should a value remain outside limits for a relatively long duration.

Value and Limit Registers

The results of fan speed measurements are stored in these registers, along with their limit values. The limit values store the slowest speed that the fans are expected to run at, or the limit value can determine what a fan failure is expected to be, in terms of running speed in case the fan doesn't completely stall. If TMP05s and TMP06s are daisy-chained in through the PWM_IN pin, then the measured temperatures are stored in temperature value registers.

T_{MIN} Registers

Programs the starting temperature for each fan under automatic fan speed control. The ADT7470 has limited automatic fan speed control capability where only one mode of operation is supported. If TMP05s are daisy-chained in, the fastest speed calculated, determined by the measured temperature, T_{MIN} and a fixed slope of 20°C can drive each fan. Fan on/off hysteresis is set at 4°C so that the fans turn off 4°C below the temperature at which they turn. This prevents fan chatter in the system.

SMBus/I²C COMMUNICATIONS INTERFACE

Serial Bus Interface

Control of the ADT7470 is carried out using the serial system management bus (SMBus). This interface is fully compatible with SMBus 2.0 electrical specifications and meets 400 pF bus capacitance requirements. The device also supports fast I²C (400 kHz max). The ADT7470 is connected to the bus as a slave device, under the control of a master controller or service processor.

The ADT7470 has a 7-bit serial bus address. When the device is powered up with Pin 11 (ADDR) high, the ADT7470 has an SMBus address of 0101111 or 0x5E (left-justified). Because the address is 7 bits, it can be left or right justified; this determines whether the address reads as 0x5x or 0x2x. Pin 11 can be left

floating or tied low for other addressing options as shown in Table 4.

Table 4. ADT7470 Address Select Mode

Pin 11 State (ADDR)	Address
High (10 kΩ to V_{CC})	0101111 (0x5E left-justified or 0x2F right-justified)
Low (10 kΩ to GND)	0101100 (0x58 left-justified or 0x2C right-justified)
Floating (no pull-up)	0101110 (0x5C left-justified or 0x2E right-justified)

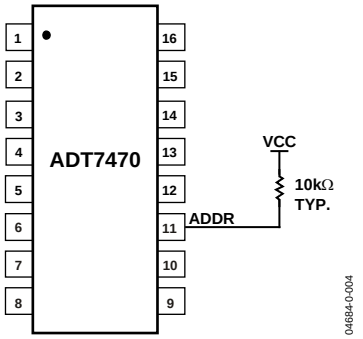

Figure 4. SMBus Address = 0x5E or 0x2F (Pin 11 = 1)

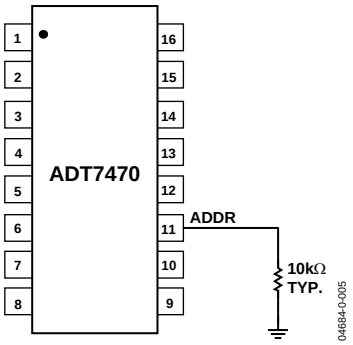

Figure 5. SMBus Address = 0x58 or 0x2C (Pin 11 = 0)

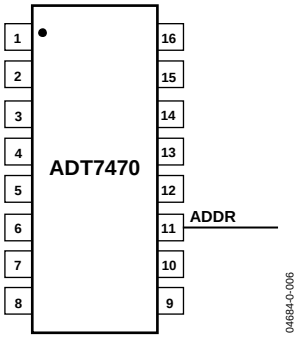

Figure 6. SMBus Address = 0x5C or 0x2E (Pin 11 = Floating)

The device address is sampled and latched on the first valid SMBus transaction, so any additional attempted addressing changes have no immediate effect. The facility to make hardwired changes to the SMBus slave address allows the user to avoid conflicts with other devices sharing the same serial bus, for example, if more than one ADT7470 is used in a system.

The serial bus protocol operates as follows:

1. The master initiates data transfer by establishing a start condition, defined as a high to low transition on the serial data line SDA while the serial clock line SCL remains high. This indicates that an address/data stream will follow. All slave peripherals connected to the serial bus respond to the start condition, and shift in the next 8 bits, consisting of a 7-bit address (MSB first) and a R/$\overline{W}$ bit, which determines the direction of the data transfer, i.e., whether data is written to or read from the slave device.

   The peripheral whose address corresponds to the transmitted address responds by pulling the data line low during the low period before the ninth clock pulse, known as the acknowledge bit. All other devices on the bus now remain idle while the selected device waits for data to be read from or written to it. If the R/$\overline{W}$ bit is a 0, then the master writes to the slave device. If the R/$\overline{W}$ bit is a 1, the master reads from the slave device.

2. Data is sent over the serial bus in sequences of 9 clock pulses, 8 bits of data followed by an acknowledge bit from the slave device. Transitions on the data line must occur during the low period of the clock signal and remain stable during the high period, as a low to high transition when the clock is high may be interpreted as a stop signal. The number of data bytes that can be transmitted over the serial bus in a single read or write operation is limited only by what the master and slave devices can handle.

3. When all data bytes have been read or written, stop conditions are established. In write mode, the master pulls the data line high during the 10th clock pulse to assert a stop condition. In read mode, the master device overrides the acknowledge bit by pulling the data line high during the low period before the 9th clock pulse. This is known as No Acknowledge. The master then takes the data line low during the low period before the 10th clock pulse, then high during the 10th clock pulse to assert a stop condition.

Any number of bytes of data can be transferred over the serial bus in one operation, but it is not possible to mix read and write in one operation, because the type of operation is determined at the beginning and subsequently cannot be changed without starting a new operation.

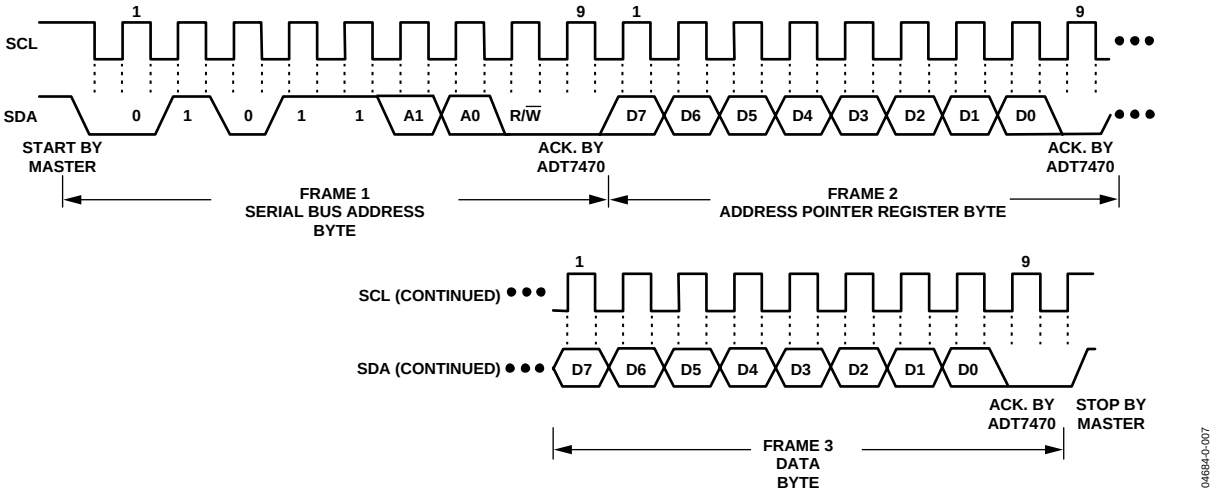

Figure 7. Writing a Register Address to the Address Pointer Register, then Writing Data to the Selected Register

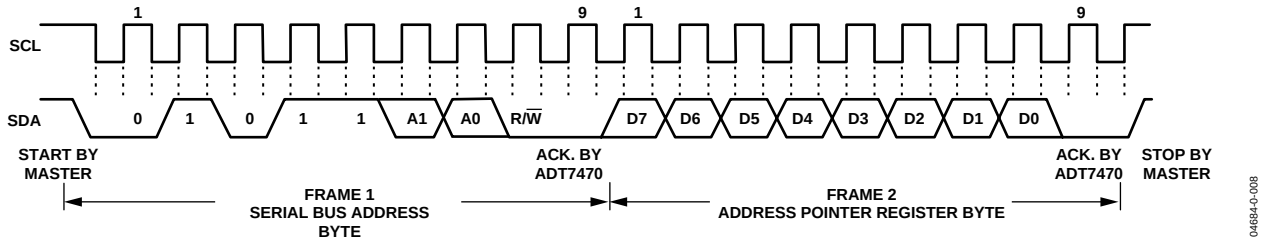

Figure 8. Writing to the Address Pointer Register Only

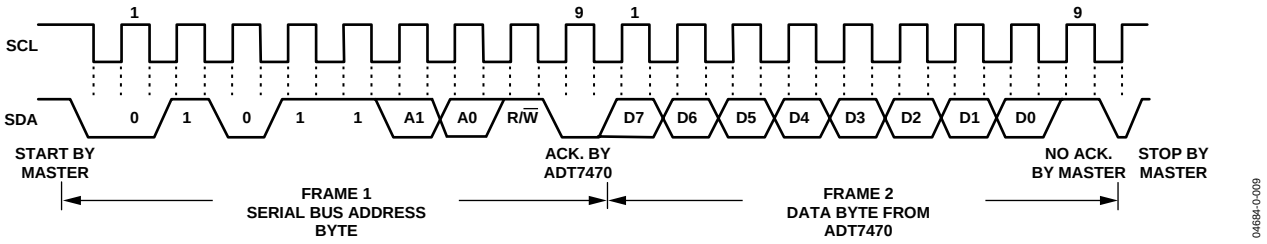

Figure 9. Reading Data from a Previously Selected Register

In the case of the ADT7470, write operations contain either one or two bytes, and read operations contain one byte, and perform the following functions.

To write data to one of the device data registers or read data from it, the address pointer register must be set so that the correct data register is addressed, then data can be written into that register or read from it. The first byte of a write operation always contains an address that is stored in the address pointer register. If data is to be written to the device, then the write operation contains a second data byte that is written to the register selected by the address pointer register.

This is illustrated in Figure 7. The device address is sent over the bus followed by R/$\overline{W}$ set to 0. This is followed by two data bytes.

The first data byte is the address of the internal data register to be written to, which is stored in the address pointer register. The second data byte is the data to be written to the internal data register.

When reading data from a register there are two possibilities:

- If the ADT7470 address pointer register value is unknown or not the desired value, it is first necessary to set it to the correct value before data can be read from the desired data register. This is done by performing a write to the ADT7470

as before, but only the data byte containing the register address is sent, as data is not to be written to the register. This is shown in Figure 8.

A read operation is then performed consisting of the serial bus address, R/$\overline{W}$ bit set to 1, followed by the data byte read from the data register. This is shown in Figure 9.

- If the address pointer register is known to be already at the desired address, data can be read from the corresponding data register without first writing to the address pointer register, so Figure 8 can be omitted.

Notes:

- Although it is possible to read a data byte from a data register without first writing to the address pointer register if the address pointer register is already at the correct value, it is not possible to write data to a register without writing to the address pointer register, because the first data byte of a write is always written to the address pointer register.
- In Figure 7 to Figure 9, the serial bus address is shown as the default value 01011(A1)(A0), where A1 and A0 are set by the address select mode function previously defined.
- In addition to supporting the send byte and receive byte protocols, the ADT7470 also supports the read byte protocol. See System Management Bus specifications Rev. 2.0 for more information.
- If it is required to perform several read or write operations in succession, the master can send a repeat start condition instead of a stop condition to begin a new operation.

ADT7470 WRITE OPERATIONS

The SMBus specification defines several protocols for different types of read and write operations. The ones used in the ADT7470 are discussed in the following sections. The following abbreviations are used in the diagrams:

S—Start

P—Stop

R—Read

W—Write

A—Acknowledge

$\overline{A}$—No Acknowledge

The ADT7470 uses the following SMBus write protocols:

Send Byte

In this operation, the master device sends a single command byte to a slave device, as follows:

1. The master device asserts a start condition on SDA.
2. The master sends the 7-bit slave address followed by the write bit (low).
3. The addressed slave device asserts ACK on SDA.
4. The master sends a command code.
5. The slave asserts ACK on SDA.
6. The master asserts a stop condition on SDA and the transaction ends.

For the ADT7470, the send byte protocol is used to write a register address to RAM for a subsequent single byte read from the same address. This is illustrated in Figure 10.

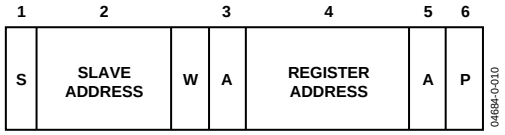

Figure 10. Setting a Register Address for Subsequent Read

If it is required to read data from the register immediately after setting up the address, the master can assert a repeat start condition immediately after the final ACK and carry out a single-byte read without asserting an intermediate stop condition.

Write Byte

In this operation, the master device sends a command byte and one data byte to the slave device, as follows:

1. The master device asserts a start condition on SDA.
2. The master sends the 7-bit slave address followed by the write bit (low).
3. The addressed slave device asserts ACK on SDA.
4. The master sends a command code.
5. The slave asserts ACK on SDA.
6. The master sends a data byte.
7. The slave asserts ACK on SDA.
8. The master asserts a stop condition on SDA to end the transaction.

This is illustrated in Figure 11.

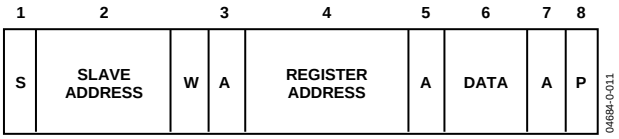

Figure 11. Single-Byte Write to a Register

ADT7470 READ OPERATIONS

The ADT7470 uses the following SMBus read protocols:

Receive Byte

This is useful when repeatedly reading a single register. The register address needs to have been set up previously. In this operation, the master device receives a single byte from a slave device, as follows:

1. The master device asserts a start condition on SDA.
2. The master sends the 7-bit slave address followed by the read bit (high).
3. The addressed slave device asserts ACK on SDA.
4. The master receives a data byte.
5. The master asserts NO ACK on SDA.
6. The master asserts a stop condition on SDA and the transaction ends.

In the ADT7470, the receive byte protocol is used to read a single byte of data from a register whose address has previously been set by a send byte or write byte operation.

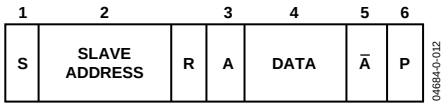

Figure 12. Single-Byte Write from a Register

Alert Response Address

Alert response address (ARA) is a feature of SMBus devices that allows an interrupting device to identify itself to the host when multiple devices exist on the same bus.

The $\overline{\text{SMBALERT}}$ output can be used as an interrupt output or can be used as an $\overline{\text{SMBALERT}}$. One or more outputs can be connected to a common $\overline{\text{SMBALERT}}$ line connected to the master. If a device's $\overline{\text{SMBALERT}}$ line goes low, the following occurs:

1. $\overline{\text{SMBALERT}}$ is pulled low.
2. Master initiates a read operation and sends the alert response address (ARA = 0001 100). This is a general call address that must not be used as a specific device address.
3. The device whose $\overline{\text{SMBALERT}}$ output is low responds to the alert response address, and the master reads its device address. The address of the device is now known, and it can be interrogated in the usual way.
4. If more than one device's $\overline{\text{SMBALERT}}$ output is low, the one with the lowest device address has priority, in accordance with normal SMBus arbitration.
5. Once the ADT7470 has responded to the alert response address, the master must read the status registers, and the $\overline{\text{SMBALERT}}$ is cleared only if the error condition has gone away.

SMBus TIMEOUT

The ADT7470 includes an SMBus timeout feature. If there is no SMBus activity for 35 ms, the ADT7470 assumes that the bus is locked and releases the bus. This prevents the device from locking or holding the SMBus expecting data. Some SMBus controllers cannot handle the SMBus timeout feature, so it can be disabled.

Table 5. Configuration Register 1—Register 0x40

Bit Address and Value	Description
<3> TODIS = 0	SMBus Timeout Enabled (default).
<3> TODIS = 1	SMBus Timeout Disabled.

.

TEMPERATURE MEASUREMENT USING TMP05/TMP06

MEASURING TEMPERATURE

For more information, refer to the TMP05/TMP06 data sheets.

TMP05 generates a PWM output proportional to temperature, which can be easily interfaced to most micros or CPUs.

The following table lists the temperature reading registers on the ADT7470.

Table 6. Temperature Reading Registers

Register	Reading	Default
0x20	Temperature 1 Reading	0x00
0x21	Temperature 2 Reading	0x00
0x22	Temperature 3 Reading	0x00
0x23	Temperature 4 Reading	0x00
0x24	Temperature 5 Reading	0x00
0x25	Temperature 6 Reading	0x00
0x26	Temperature 7 Reading	0x00
0x27	Temperature 8 Reading	0x00
0x28	Temperature 9 Reading	0x00
0x29	Temperature 10 Reading	0x00

8-bit temperature values are reported in the preceding registers only if the PWM_IN function is used and if TMP05s/TMP06s are daisy-chained according to their respective data sheets and connected as shown in Figure 13. Note that this device does NOT have any temperature measurement capability when used as a standalone device, without TMP05s/TMP06s connected.

TMP05/TMP06 DECODER

The ADT7470 includes a PWM processing engine to decode the daisy-chained PWM output from multiple TMP05s/TMP06s and passes each decoded temperature value to temperature value registers. This allows the ADT7470 to do high/low limit comparisons of temperature and to automatically control fan speed based on measured temperature. The PWM processing engine contains all necessary logic to initiate start conversions on the first daisy-chained TMP05/TMP06 and synchronize with each temperature value as it is fed back to the device through the daisy chain. The start function is multiplexed on to the same pin that can be used to blast the fans to full speed. The start conversion for TMP05/TMP06 temperature measurement is fully transparent to the user and doesn't require any software intervention to function.

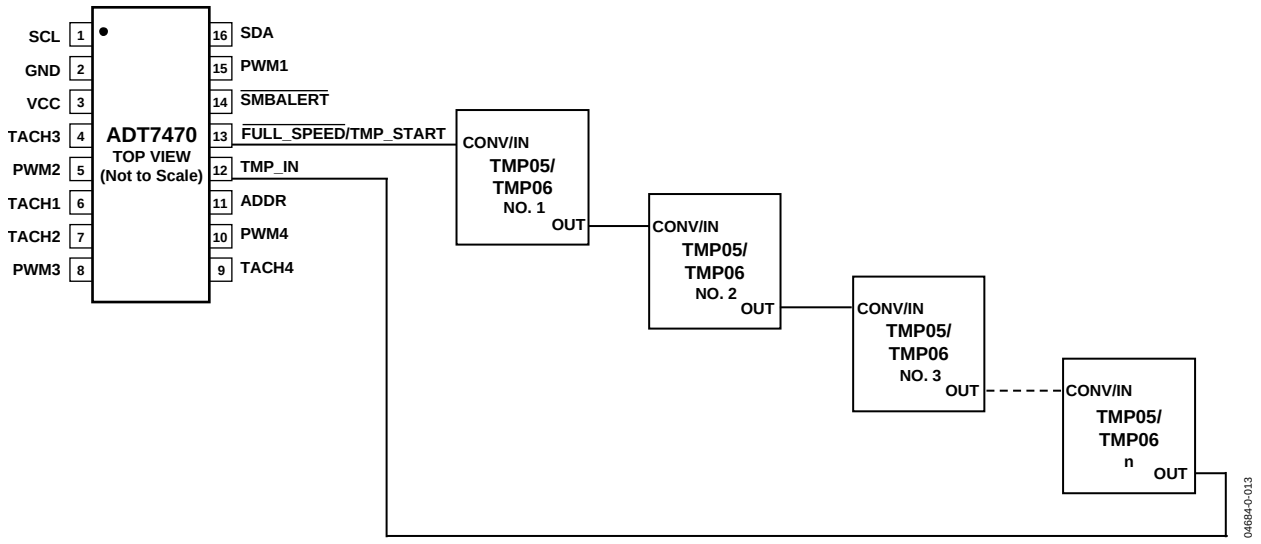

Figure 13. Interfacing the ADT7470 to Multiple Daisy-Chained TMP05/TMP06 Temperature Sensors

INTERRUPT FUNCTIONALITY AND STATUS REGISTERS

LIMIT VALUES

Associated with each measurement channel on the ADT7470 are high and low limits. These can form the basis of system status monitoring: a status bit can be set for any out-of-limit condition and be detected by polling the device. Alternatively, $\overline{\text{SMBALERT}}$ interrupts can be generated to automatically flag a service processor or microcontroller of out-of-limit conditions as they occur.

8-BIT LIMITS

The following table lists the 8-bit limits on the ADT7470.

Table 7. Temperature Limit Registers (8-Bit Limits)

Register Address	Description	Default
0x44	Temperature 1 Low Limit	0x81
0x45	Temperature 1 High Limit	0x7F
0x46	Temperature 2 Low Limit	0x81
0x47	Temperature 2 High Limit	0x7F
0x48	Temperature 3 Low Limit	0x81
0x49	Temperature 3 High Limit	0x7F
0x4A	Temperature 4 Low Limit	0x81
0x4B	Temperature 4 High Limit	0x7F
0x4C	Temperature 5 Low Limit	0x81
0x4D	Temperature 5 High Limit	0x7F
0x4E	Temperature 6 Low Limit	0x81
0x4F	Temperature 6 High Limit	0x7F
0x50	Temperature 7 Low Limit	0x81
0x51	Temperature 7 High Limit	0x7F
0x52	Temperature 8 Low Limit	0x81
0x53	Temperature 8 High Limit	0x7F
0x54	Temperature 9 Low Limit	0x81
0x55	Temperature 9 High Limit	0x7F
0x56	Temperature 10 Low Limit	0x81
0x57	Temperature 10 High Limit	0x7F

16-BIT LIMITS

The fan tach measurements are 16-bit results. The fan tach limits are also 16-bits; consisting of 2 bytes; a high byte and low byte. On the ADT7470 it is possible to set both high and low speed fan limits for overspeed and underspeed or stall conditions. Be aware that since fan tach period is actually being measured, exceeding the limit by 1 indicates a slow or stalled fan. Likewise, exceeding the high speed limit by 1 generates an overspeed condition.

Table 8. Fan Underspeed Limit Registers

Register Address	Description	Default
0x58	Tach 1 Min Low Byte	0xFF
0x59	Tach 1 Min High Byte	0xFF
0x5A	Tach 2 Min Low Byte	0xFF
0x5B	Tach 2 Min High Byte	0xFF
0x5C	Tach 3 Min Low Byte	0xFF
0x5D	Tach 3 Min High Byte	0xFF
0x5E	Tach 4 Min Low Byte	0xFF

Table 9. Fan Overspeed Limit Registers

Register Address	Description	Default
0x60	Tach 1 Max Low Byte	0x00
0x61	Tach 1 Max High Byte	0x00
0x62	Tach 2 Max Low Byte	0x00
0x63	Tach 2 Max High Byte	0x00
0x64	Tach 3 Max Low Byte	0x00
0x65	Tach 3 Max High Byte	0x00
0x66	Tach 4 Max Low Byte	0x00
0x67	Tach 4 Max High Byte	0x00

OUT-OF-LIMIT COMPARISONS

Once all limits have been programmed, the ADT7470 can be enabled monitoring. The ADT7470 measures all parameters in round-robin format and set the appropriate status bit for out-of-limit conditions. Comparisons are done differently depending on whether the measured value is being compared to a high or low limit.

High Limit: > Comparison Performed

Low Limit: ≤ Comparison Performed

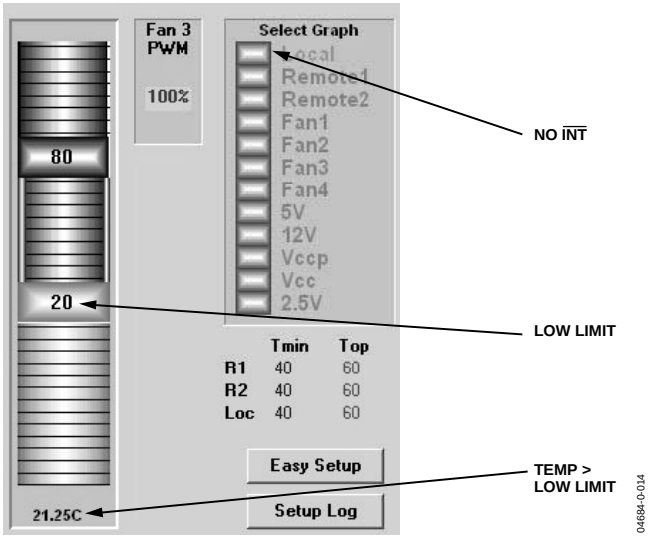

Figure 14. Temperature > Low Limit—No $\overline{INT}$

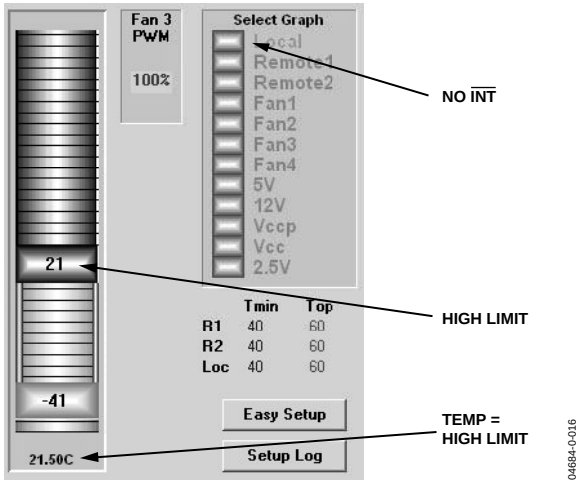

Figure 16. Temperature = High Limit—No $\overline{INT}$

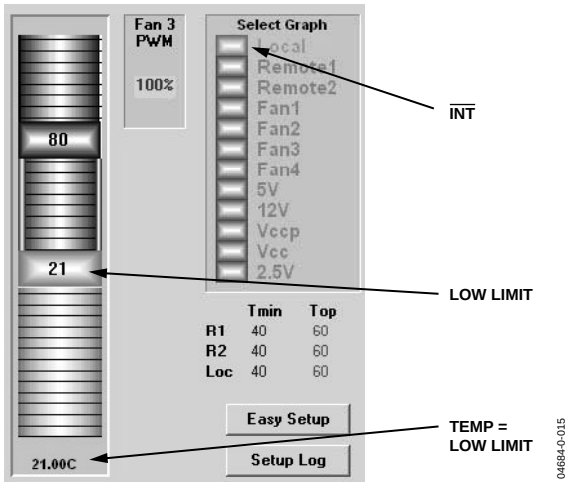

Figure 15. Temperature = Low Limit—$\overline{INT}$ Occurs

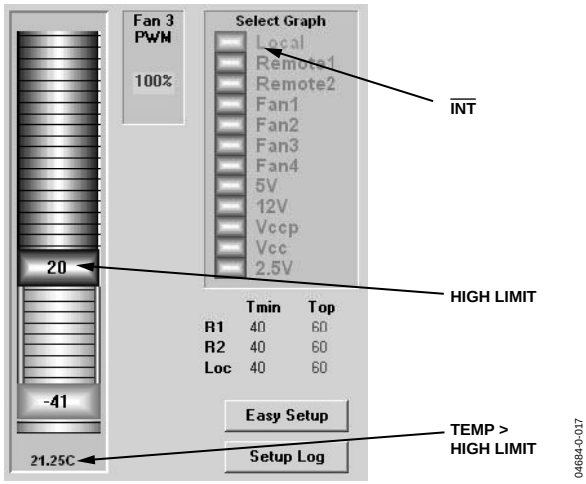

Figure 17. Temperature > High Limit—$\overline{INT}$ Occurs

MONITORING CYCLE TIME

The monitoring cycle begins when a one is written to the start bit (Bit 0) of Configuration Register 1 (Register 0x40). Each fan tach input is monitored in turn, and as each measurement is completed, the result is automatically stored in the appropriate value register. Multiple temperature channels can also be monitored by clocking in temperatures by using the PWM_IN pin. The temperature measurement function is addressed in hardware and requires no software intervention. The monitoring cycle continues unless disabled by writing a 0 to Bit 0 of Configuration Register 1.

The rate of temperature measurement updates depends on the nominal conversion rate of the TMP05/TMP06 temperature sensor (approximately 120 ms) and on the number of TMP05s daisy-chained together. The total monitoring cycle time is the temperature conversion time multiplied by the number of temperature channels being monitored.

Fan tach measurements are taken in parallel and are not synchronized with the temperature measurements in any way.

STATUS REGISTERS

The results of limit comparisons are stored in Status Registers 1 and 2. The status register bit for each channel reflects the status of the last measurement and limit comparison on that channel. If a measurement is within limits, the corresponding status register bit is cleared to 0. If the measurement is out-of-limits, the corresponding status register bit is set to 1.

The state of the various measurement channels may be polled by reading the status registers over the serial bus. Bit 7 (OOL) of Status Register 1 (Register 0x41) when 1 means that an out-of-limit event has been flagged in Status Register 2. This means that you need to read Status Register 2 only when the OOL bit is set. Alternatively, Pin 11 operates as an $\overline{\text{SMBALERT}}$ output and can be connected back to the system service processor. This automatically notifies the system supervisor of an out-of-limit condition. Reading the status registers clears the appropriate status bit as long as the error condition that caused the interrupt has cleared. Status register bits are "sticky." Whenever a status bit is set, indicating an out-of-limit condition, it remains set even if the event that caused it has gone away (until read). The only way to clear the status bit is to read the status register when the event has gone away. Interrupt status mask registers (Registers 0x72 and 0x73) allow individual interrupt sources to be masked from causing an SMBALERT. However, if one of these masked interrupt sources goes out-of-limit, its associated status bit is still set in the interrupt status registers. This allows the device to be periodically polled to determine if an error condition has subsided, without unnecessarily tying up precious system resources handling interrupt service routines. The issue is that the device could potentially interrupt the system every monitoring cycle (< 1 sec) as long as a measurement parameter remains out-of-limit. Masking eliminates unwanted system interrupts.

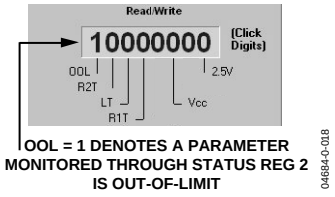

Figure 18. Interrupt Status Register 1

Table 10. Interrupt Status Register 1 (Register 0x41)

Bit No. and Value	Description
Bit 7 (OOL) = 1,	Denotes a bit in Status Register 2 is set and Status Register 2 should now be read.
Bit 6 (R7T) = 1	TMP05 Temperature 7 high or low limit has been exceeded.
Bit 5 (R6T) = 1	TMP05 Temperature 6 high or low limit has been exceeded.
Bit 4 (R5T) = 1	TMP05 Temperature 5 high or low limit has been exceeded.
Bit 3 (R4T) = 1	TMP05 Temperature 4 high or low limit has been exceeded.
Bit 2 (R3T) = 1	TMP05 Temperature 3 high or low limit has been exceeded.
Bit 1 (R2T) = 1	TMP05 Temperature 2 high or low limit has been exceeded.
Bit 0 (R1T) = 1	TMP05 Temperature 1 high or low limit has been exceeded.

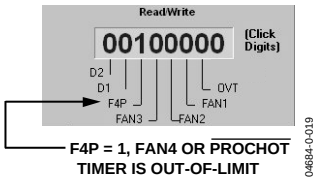

Figure 19. Interrupt Status Register 2

Table 11. Interrupt Status Register 2 (Register 0x42)

Bit No. and Value	Description
Bit 7 (Fan 4) = 1	Indicates that Fan 4 has dropped below minimum speed or is above maximum speed.
Bit 6 (Fan 3) = 1	Indicates that Fan 3 has dropped below minimum speed or is above maximum speed.
Bit 5 (Fan 2) = 1	Indicates that Fan 2 has dropped below minimum speed or is above maximum speed.
Bit 4 (Fan 1) = 1	Indicates that Fan 1 has dropped below minimum speed or is above maximum speed.
Bit 3 (NORM) = 1	Indicates that the temperatures are below T_{MIN} and that the fans are supposed to be off.
Bit 2 (R10T) = 1	TMP05 Temperature 10 high or low limit has been exceeded.
Bit 1 (R9T) = 1	TMP05 Temperature 9 high or low limit has been exceeded.
Bit 0 (R8T) = 1	TMP05 Temperature 8 high or low limit has been exceeded.

$\overline{\text{SMBALERT}}$ INTERRUPT BEHAVIOR

The ADT7470 can be polled for status, or an $\overline{\text{SMBALERT}}$ interrupt can be generated for out-of-limit conditions. It is important to note how the $\overline{\text{SMBALERT}}$ output and status bits behave when writing interrupt handler software.

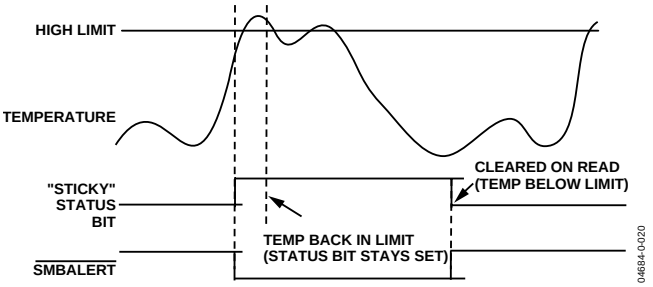

Figure 20. $\overline{\text{SMBALERT}}$ and Status Bit Behavior

Figure 20 shows how the $\overline{\text{SMBALERT}}$ output and sticky status bits behave. Once a limit is exceeded, the corresponding status bit is set to 1. The status bit remains set until the error condition subsides AND the status register are read. The status bits are referred to as sticky since they remain set until read by software. This ensures that an out-of-limit event cannot be missed if software is polling the device periodically. Note that the $\overline{\text{SMBALERT}}$ output remains low for the entire duration that a reading is out-of-limit and until the status register has been read. This has implications on how software handles the interrupt.

HANDLING $\overline{\text{SMBALERT}}$ INTERRUPTS

To prevent the system from being tied up servicing interrupts, it is recommend to handle the $\overline{\text{SMBALERT}}$ interrupt as follows:

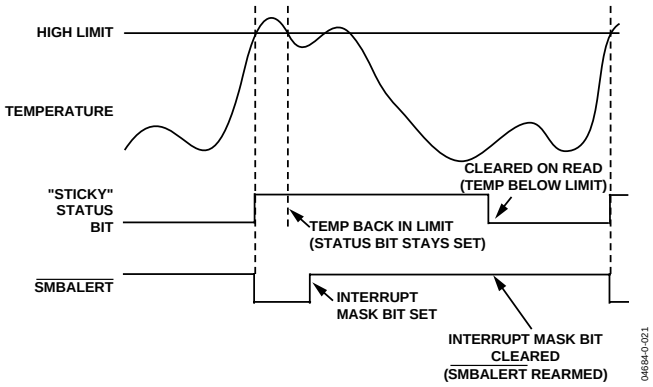

Figure 21. How Masking the Interrupt Source Affects $\overline{\text{SMBALERT}}$ Output

1. Detect the $\overline{\text{SMBALERT}}$ assertion.
2. Enter the interrupt handler.
3. Read the status registers to identify the interrupt source.
4. Mask the interrupt source by setting the appropriate mask bit in the interrupt mask registers (Registers 0x72 and 0x73).
5. Take the appropriate action for a given interrupt source.
6. Exit the interrupt handler.
7. Periodically poll the status registers. If the interrupt status bit has cleared, reset the corresponding interrupt mask bit to 0. This causes the $\overline{\text{SMBALERT}}$ output and status bits to behave as shown in Figure 21.

MASKING INTERRUPT SOURCES

Interrupt Mask Registers 1 and 2 are located at Addresses 0x72 and 0x73. These allow individual interrupt sources to be masked out to prevent unwanted $\overline{\text{SMBALERT}}$ interrupts. Note that masking an interrupt source only prevents the $\overline{\text{SMBALERT}}$ output from being asserted; the appropriate status bit is still set as usual. This is useful if the system polls the monitoring devices periodically to determine whether or not out-of-limit conditions have subsided, without tying up time-critical system resources.

ENABLING THE $\overline{\text{SMBALERT}}$ INTERRUPT OUTPUT

The $\overline{\text{SMBALERT}}$ interrupt output is a dedicated function that is provided on Pin 14 to signal out-of-limit conditions to a host or system processor. Because this is a dedicated function, it is important that limit registers get programmed before monitoring gets enabled, to prevent spurious interrupts occurring on the $\overline{\text{SMBALERT}}$ pin. Although the $\overline{\text{SMBALERT}}$ output cannot be specifically disabled, interrupt sources can be masked to prevent $\overline{\text{SMBALERT}}$ assertions. Monitoring is enabled when Bit 0 (STRT) of Configuration Register 1 (Register 0x40) is set to 1.

Table 12. Interrupt Mask Register 1 (Register 0x72)

Bit No. and Value	Description
Bit 7 (OOL) = 1	Masks $\overline{\text{SMBALERT}}$ for any alert condition flagged in Status Register 2.
Bit 6 (R7T) = 1	Masks $\overline{\text{SMBALERT}}$ for TMP05 Temperature 7.
Bit 5 (R6T) = 1	Masks $\overline{\text{SMBALERT}}$ for TMP05 Temperature 6.
Bit 4 (R5T) = 1	Masks $\overline{\text{SMBALERT}}$ for TMP05 Temperature 5.
Bit 3 (R4T) = 1	Masks $\overline{\text{SMBALERT}}$ for TMP05 Temperature 4.
Bit 2 (R3T) = 1	Masks $\overline{\text{SMBALERT}}$ for TMP05 Temperature 3.
Bit 1 (R2T) = 1	Masks $\overline{\text{SMBALERT}}$ for TMP05 Temperature 2.
Bit 0 (R1T) = 1	Masks $\overline{\text{SMBALERT}}$ for TMP05 Temperature 1.

Table 13. Interrupt Mask Register 2 (Register 0x73)

Bit No. and Value	Description
Bit 7 (Fan 4) = 1	Masks $\overline{\text{SMBALERT}}$ for Fan 4 overspeed/ underspeed conditions.
Bit 6 (Fan 3) = 1	Masks $\overline{\text{SMBALERT}}$ for Fan 3 overspeed/ underspeed conditions.
Bit 5 (Fan 2) = 1	Masks $\overline{\text{SMBALERT}}$ for Fan 2 overspeed/ underspeed conditions.
Bit 4 (Fan 1) = 1	Masks $\overline{\text{SMBALERT}}$ for Fan 1 overspeed/ underspeed conditions.
Bit 3 (NORM) = 1	Masks $\overline{\text{SMBALERT}}$ for temperatures below T_{MIN}.
Bit 2 (R10T) = 1	Masks $\overline{\text{SMBALERT}}$ for TMP05 Temperature 10.
Bit 1 (R9T) = 1	Masks $\overline{\text{SMBALERT}}$ for TMP05 Temperature 9.
Bit 0 (R8T) = 1	Masks $\overline{\text{SMBALERT}}$ for TMP05 Temperature 8.

FAN DRIVE USING PWM CONTROL

The ADT7470 uses pulse width modulation (PWM) to control fan speed. This relies on varying the duty cycle (or on/off ratio) of a square wave applied to the fan, to vary the fan speed. Two main control schemes are used: low frequency and high frequency PWM. For low frequency, low-side drive, the external circuitry required to drive a fan using PWM control is extremely simple. A single NMOS FET is the only drive device required. The specifications of the MOSFET depends on the maximum current required by the fan being driven. Typical notebook fans draw a nominal 170 mA, therefore SOT devices can be used where board space is a concern. In desktops, fans can typically draw 250 mA to 300 mA each. If the user need to drive several fans in parallel from a single PWM output, or drive larger server fans, the MOSFET needs to handle the higher current requirements. The only other stipulation is that the MOSFET should have a gate voltage drive, VGS < 3.3 V for direct interfacing to the PWM_OUT pin of the TSM devices. VGS of the chosen MOSFET can be greater than 3.3 V as long as the pull-up on its gate is tied to 5 V. The MOSFET should also have a low on-resistance to ensure that there is not significant voltage drop across the FET. This would reduce the voltage applied across the fan and therefore the maximum operating speed of the fan.

Figure 22 shows how a 3-wire fan can be driven using low frequency PWM control where the control method is low-side, low frequency switching.

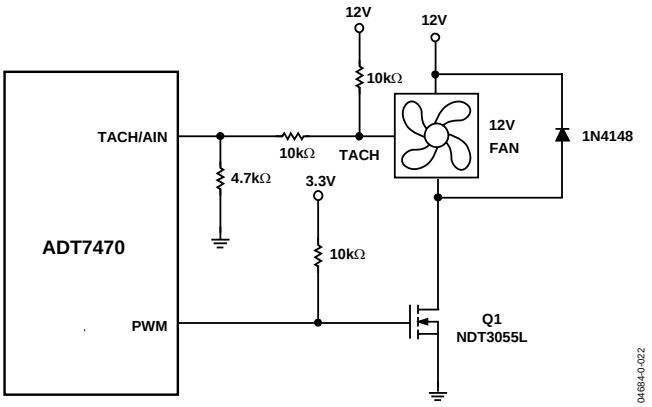

Figure 22. Driving a 3-Wire Fan Using an N-Channel MOSFET

Figure 22 shows the ideal interface when interfacing a tach signal from a 12 V fan (or greater voltage) to a 5 V (or less) logic device. In all cases, the tach signal from the fan must be kept below 5 V maximum to prevent damage to the ADT7470. The three resistors in Figure 22 ensure that the tach voltage is kept within safe levels for typical desktop and notebook systems. Figure 23 shows a fan drive circuit using an NPN transistor such as a general-purpose MMBT2222. While these devices are inexpensive, they tend to have much lower current handling capabilities and higher on resistance than MOSFETs. When choosing a transistor, care should be taken in ensuring that it meets the fan's current requirements. This is the only major difference between a MOSFET and NPN transistor fan driver circuit.

When using transistors, ensure that the base resistor is chosen such that the transistor is fully saturated when the fan is powered on. Otherwise, there are power inefficiencies in the implementation.

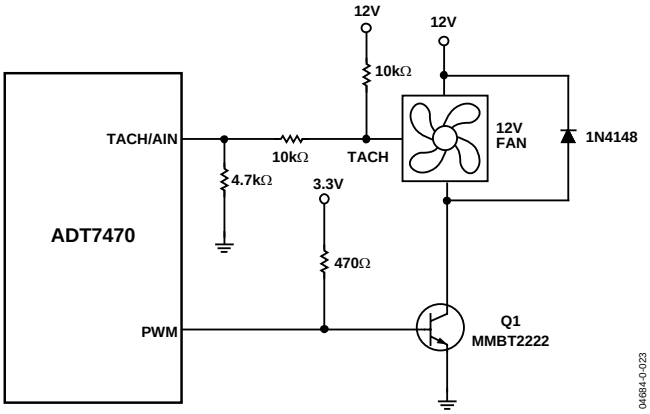

Figure 23. Driving a 3-Wire Fan Using an NPN Transistor

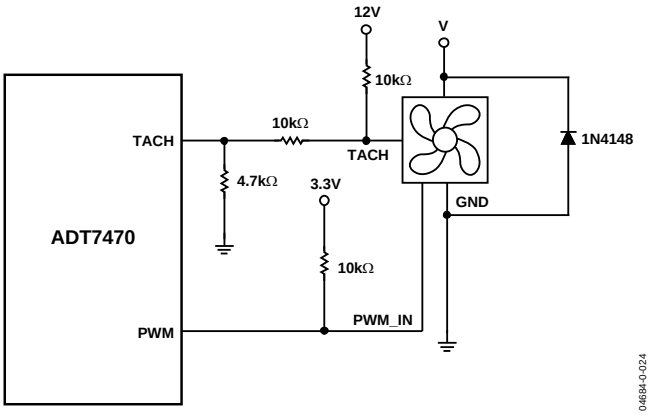

Figure 24. Driving a 4-Wire Fan

High Frequency vs. Low Frequency

One of the important features of fan controllers is the PWM drive frequency. Today, most fans are driven asynchronously at low frequency (30 Hz to 100 Hz).Going forward, the devices drive fans at >20 kHz. These controllers are meant to drive 4-wire fans with PWM control built-in internal to the fan. Note that the ADT7470 supports high frequency PWM (>20 kHz) as well as 1.4 kHz and other low frequency PWM. This allows the user to drive 3-wire or 4-wire fans.

FAN SPEED MEASUREMENT

TACH INPUTS

Pins 6, 7, 4, and 9 are open-drain tach inputs intended for fan speed measurement.

Signal conditioning in the ADT7470 accommodates the slow rise and fall times typical of fan tachometer outputs. The maximum input signal range is 0 V to 5 V, even where V_{CC} is less than 5 V. In the event that these inputs are supplied from fan outputs that exceed 0 V to 5 V, either resistive attenuation of the fan signal or diode clamping must be included to keep inputs within an acceptable range. Figure 25 to Figure 28 show circuits for most common fan tach outputs.

If the fan tach output has a resistive pull-up to V_{CC} then it can be connected directly to the fan input, as shown in Figure 25.

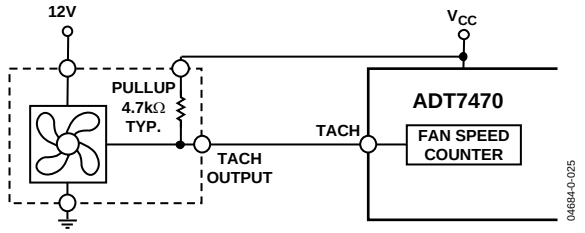

Figure 25. Fan with Tach Pull-Up to +V_{CC}

If the fan output has a resistive pull-up to 12 V (or other voltage greater than 5 V) then the fan output can be clamped with a Zener diode, as shown in Figure 26. The Zener diode voltage should be chosen so that it is greater than V_{IH} of the tach input but less than 5 V, allowing for the voltage tolerance of the Zener. A value of between 3 V and 5 V is suitable.

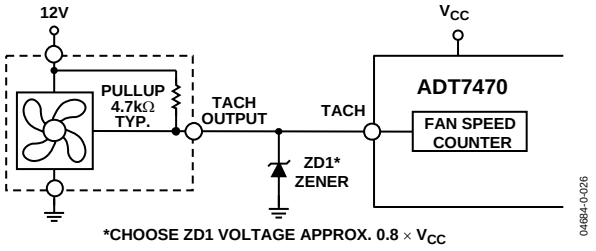

Figure 26. Fan with Tach.
Pull-up to voltage >5 V, for example., 12 V clamped with Zener diode.

If the fan output has a resistive pull-up to 12 V (or other voltage greater than 5 V), then the fan output can be clamped with a Zener diode, as shown in Figure 26. The Zener diode voltage should be chosen so that it is greater than V_{IH} of the tach input but less than 5 V, allowing for the voltage tolerance of the Zener. A value of between 3 V and 5 V is suitable. If the fan has a strong pull-up (less than 1 kΩ) to 12 V, or a totem-pole output, then a series resistor can be added to limit the Zener current, as shown in Figure 27. Alternatively, a resistive attenuator may be used, as shown in Figure 28.

R1 and R2 should be chosen such that

$$2\text{ V} < V_{PULL\text{-}UP} \times R2/(R_{PULL\text{-}UP} + R1 + R2) < 5\text{ V}$$

The fan inputs have an input resistance of nominally 160 kΩ to ground, so this should be taken into account when calculating resistor values.

With a pull-up voltage of 12 V and pull-up resistor less than 1 kΩ, suitable values for R1 and R2 would be 100 kΩ and 47 kΩ. This gives a high input voltage of 3.83 V.

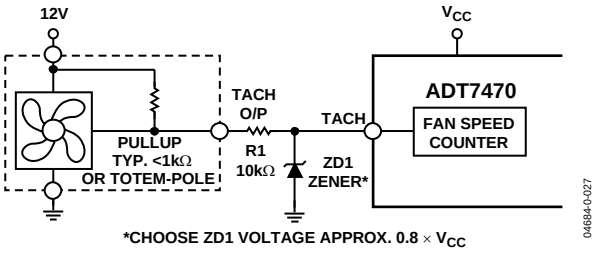

Figure 27. Fan with Strong Tach.
Pull-up to >V_{CC} or totem-pole output, clamped with zener and resistor.

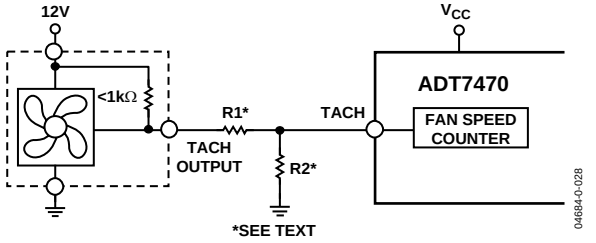

Figure 28. Fan with Strong Tach.
Pull-up to > V_{CC} or totem-pole output, attenuated with R1/R2.

FAN SPEED MEASUREMENT

The fan counter does not count the fan tach output pulses directly, because the fan speed may be less than 1000 RPM and it would take several seconds to accumulate a reasonably large and accurate count. Instead, the period of the fan revolution is measured by gating an on-chip 90 kHz oscillator into the input of a 16-bit counter for N periods of the fan tach output, as shown in Figure 29, so the accumulated count is actually proportional to the fan tachometer period and inversely proportional to the fan speed.

N, the number of pulses counted is determined by the settings of Register 0x43 (fan pulses per revolution register). This register contains two bits for each fan, allowing 1, 2 (default), 3, or 4 tach pulses to be counted.

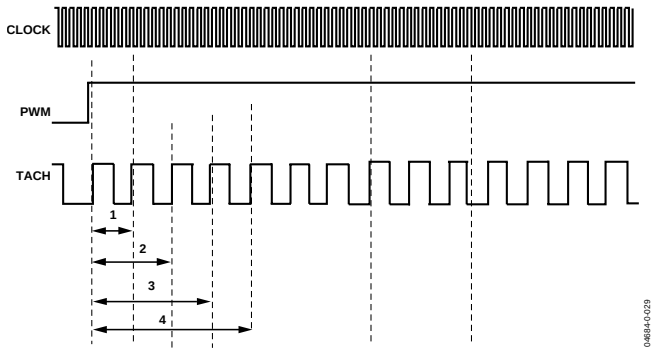

Figure 29. Fan Speed Measurement

Fan Speed Measurement Registers

The fan tachometer readings are 16-bit values consisting of a 2-byte read from the ADT7470.

Table 14. Fan Speed Measurement Registers

Register Address	Description	Default
0x2A	Tach 1 Low Byte	0x00
0x2B	Tach 1 High Byte	0x00
0x2C	Tach 2 Low Byte	0x00
0x2D	Tach 2 High Byte	0x00
0x2E	Tach 3 Low Byte	0x00
0x2F	Tach 3 High Byte	0x00
0x30	Tach 4 Low Byte	0x00
0x31	Tach 4 High Byte	0x00

Reading Fan Speed from the ADT7470

If fan speeds are being measured, this involves a 2-register read for each measurement. The low byte should be read first. This causes the high byte to be frozen until both high and low byte registers have been read from. This prevents erroneous tach readings.

The fan tachometer reading registers report back the number of 11.11 ms period clocks (90 kHz oscillator) gated to the fan speed counter, from the rising edge of the first fan tach pulse to the rising edge of the third fan tach pulse (assuming 2 pulses per revolution is being counted). Since the device is essentially measuring the fan tach period, the higher the count value, the slower the fan is actually running. A 16-bit fan tachometer reading of 0xFFFF indicates either that the fan has stalled or is running very slowly (<100 RPM).

High Limit: Comparison Performed

Because the actual fan tach period is being measured, exceeding a fan tach limit by 1 sets the appropriate status bit and can be used to generate an SMBALERT.

Fan Tach Limit Registers

The fan tach limit registers are 16-bit values consisting of two bytes. Minimum limits determine fan underspeed limits while maximum limits determine fan overspeed settings.

Table 15. Fan Tach Limit Registers

Register Address	Description	Default
0x58	Tach 1 Min Low Byte	0xFF
0x59	Tach 1 Min High Byte	0xFF
0x5A	Tach 2 Min Low Byte	0xFF
0x5B	Tach 2 Min High Byte	0xFF
0x5C	Tach 3 Min Low Byte	0xFF
0x5D	Tach 3 Min High Byte	0xFF
0x5E	Tach 4 Min Low Byte	0xFF
0x5F	Tach 4 Min High Byte	0xFF
0x60	Tach 1 Max Low Byte	0x00
0x61	Tach 1 Max High Byte	0x00
0x62	Tach 2 Max Low Byte	0x00
0x63	Tach 2 Max High Byte	0x00
0x64	Tach 3 Max Low Byte	0x00
0x65	Tach 3 Max High Byte	0x00
0x66	Tach 4 Max Low Byte	0x00
0x67	Tach 4 Max High Byte	0x00

Fan Speed Measurement Rate

The fan tach readings are normally updated once every second.

Calculating Fan Speed

Assuming a fan with 2 pulses/revolution (and 2 pulses/rev being measured) fan speed is calculated by

$$\textit{Fan Speed}\ (\text{RPM}) = (90{,}000 \times 60)/\ \textit{Fan Tach Reading}$$

where *Fan Tach Reading* is the 16-bit fan tachometer reading.

For example:

Tach 1 High Byte (Reg 0x2B) = 0x17

Tach 1 Low Byte (Reg 0x2A) = 0xFF

What is Fan 1 speed in RPM?

Fan 1 tach reading = 0x17FF = 6143 decimal.

RPM = (f × 60)/Fan 1 tach reading

RPM = (90000 × 60)/6143

Fan Speed = 879 RPM

Fan Pulses per Revolution

Different fan models can output either 1, 2, 3, or 4 tach pulses per revolution. Once the number of fan tach pulses has been determined, it can be programmed in to the fan pulses per revolution register (Register 0x43) for each fan. Alternatively, this register can be used to determine the number or pulses/ revolution output by a given fan. By plotting fan speed measurements at 100% speed with different pulses/rev setting, the smoothest graph with the lowest ripple determines the correct pulses/rev value.

Fan Spin Up

The ADT7470 has a unique fan spin-up function. Fans are 100% on if there is no interaction with the ADT7470.It incorporates a 2 second bus alive/dead detection feature. If no bus activity is seen and the ADT7470 is not specifically written to within 2 seconds, then the PWM outputs auto drive 100%. This is useful where a system lock-up occurs before software has a chance to configure the basic system devices. This is intended as a bus communication failsafe feature. Where normal communication occurs, the fans are given "grace time" to spin up, before the PWM auto throttles back to some normal speed. For example, under normal conditions the ADT7470 spins the fan at 100% PWM duty cycle until 2 tach pulses are detected on the tach input. Once 2 pulses are detected, the PWM duty cycle goes to the expected running value, for example, 33%. The advantage of this is that fans with different spin-up characteristics that take different times to overcome inertia still spin up and not generate excess acoustic noise. The ADT7470 just runs the fans fast enough to overcome inertia and is quieter on spin-up than fans programmed to spin-up for a fixed spin-up time.

Fan Start Up Timeout

To prevent false interrupts being generated as a fan spins up (because it is below running speed), the ADT7470 includes a fan start-up timeout function. This is the time limit allowed for 2 tach pulses to be detected on spin-up. The fan start-up timeout is fixed at 2 seconds, and if no tach pulses occur within 2 seconds of the start of spin-up, a fan fault is detected and flagged in the interrupt status registers.

Table 16. PWM1/PWM2 Configuration (Register 0x68)

Bit No.	Mnenonic	Description
<0>	FAIL2	Setting this bit to 1 causes all fans to spin 100% if Fan 2 fails.
<1>	FAIL1	Setting this bit to 1 causes all fans to spin 100% if Fan 1 fails.
<2>	OVT2	Setting this bit to 1 causes Fan 2 to spin 100% if any overtemperature condition occurs.
<3>	OVT1	Setting this bit to 1 causes Fan 1 to spin 100% if any overtemperature condition occurs.
<4>	INV2	Setting this bit to 1 inverts the PWM2 out put. Default = 0 drives a logic high for 100% duty cycle.
<5>	INV1	Setting this bit to 1 inverts the PWM1 out put. Default = 0 drives a logic high for 100% duty cycle.
<6>	BHVR2	This bit determines fan behavior for PWM2 output. 0 = Manual mode (PWM2 duty cycle controlled in software). 1 = Fastest speed calculated by all temperatures control PWM2 (automatic fan control mode).
<7>	BHVR1	This bit determines fan behavior for PWM1 output. 0 = Manual mode (PWM1 duty cycle controlled in software). 1 = Fastest speed calculated by all temperatures control PWM1 (automatic fan control mode).

Table 17. PWM3/PMW4 Configuration (Register 0x69)

Bit	Mnemonic	Description
<0>	FAIL4	Setting this bit to 1 causes all fans to spin 100% if Fan 4 fails.
<1>	FAIL3	Setting this bit to 1 causes all fans to spin 100% if Fan 3 fails.
<2>	OVT4	Setting this bit to 1 causes Fan 4 to spin 100% if any overtemperature condition occurs.
<3>	OVT3	Setting this bit to 1 causes Fan 3 to spin 100% if any overtemperature condition occurs.
<4>	INV4	Setting this bit to 1 inverts the PWM4 output. Default = 0 drives a logic high for 100% duty cycle.
<5>	INV3	Setting this bit to 1 inverts the PWM3 output. Default = 0 drives a logic high for 100% duty cycle.
<6>	BHVR4	This bit determines fan behavior for PWM4 output. 0 = Manual mode (PWM4 duty cycle controlled in software). 1 = Fastest speed calculated by all temperatures control PWM4 (automatic fan control mode).
<7>	BHVR3	This bit determines fan behavior for PWM3 output. 0 = Manual mode (PWM3 duty cycle controlled in software). 1 = Fastest speed calculated by all temperatures control PWM3 (automatic fan control mode).

FAN SPEED CONTROL

PWM LOGIC STATE

The PWM outputs can be programmed to be high for 100% duty cycle (non-inverted) or low for 100% duty cycle (inverted).

Table 18. PWM1/PWM2 Configuration (Register 0x68)

Bit	Mnemonic	Description
<5>	INV1	0 = Logic high for 100% PWM1 duty cycle. 1 = Logic low for 100% PWM1 duty cycle.
<4>	INV2	0 = Logic high for 100% PWM2 duty cycle. 1 = Logic low for 100% PWM2 duty cycle.

Table 19. PWM3/PWM4 Configuration (Register 69H)

Bit	Mnemonic	Description
<5>	INV3	0 = Logic high for 100% PWM3 duty cycle. 1 = Logic low for 100% PWM3 duty cycle.
<4>	INV4	0 = Logic high for 100% PWM4 duty cycle. 1 = Logic low for 100% PWM4 duty cycle.

PWM Drive Frequency

The PWM drive frequency is variable on the ADT7470. The PWM drive frequency is a high frequency signal greater than 20 kHz. This is most suitable for use with 4-wire fans. It is also possible to use low frequency PWM drive, such as 1.4 kHz.

MANUAL FAN SPEED CONTROL

The ADT7470 allows the duty cycle of any PWM output to be manually adjusted. This can be useful if users want to change fan speed in software or want to adjust PWM duty cycle output for test purposes. The PWM current duty cycle registers (Register 0x32 to 0x35) can be written with 8-bit values in manual fan speed control mode to manually adjust the speeds of the cooling fans.

PWM Configuration (Register 0X68, 0X69)

These registers control the behavior of the fans under certain conditions as well as define whether the fans are being used in manual or automatic fan speed control mode.

Programming the PWM Current Duty Cycle Registers

The PWM current duty cycle registers are 8-bit registers that allow the PWM duty cycle for each output to be set anywhere from 0% to 100%. This allows PWM duty cycle to be set in steps of 0.39%.

The value to be programmed into the PWMMIN register is given by

$$Value\ (decimal) = PWM_{MIN}/0.39$$

Example 1: For a PWM Duty Cycle of 50%

Value (*decimal*) = 50/0.39 = 128 *decimal*
Value = 128 *decimal* or 80 *hex*.

Example 2: For a PWM Duty Cycle of 33%

Value (*decimal*) = 33/0.39 = 85 *decimal*
Value = 85 *decimal* or 54 *hex*.

Table 20. PWM Duty Cycle Registers

Register Address	Description	Default
0x32	PWM1 Duty Cycle	0xFF (100%)
0x33	PWM2 Duty Cycle	0xFF (100%)
0x34	PWM3 Duty Cycle	0xFF (100%)
0x35	PWM4 Duty Cycle	0xFF (100%)

By reading the PWMx current duty cycle registers you can keep track of the current duty cycle on each PWM output, even when the fans are running in automatic fan speed control mode.

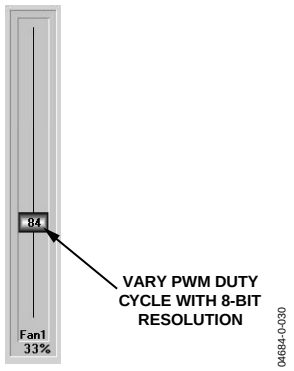

Figure 30. Control PWM Duty Cycle Manually with a Resolution of 0.39%

AUTOMATIC FAN SPEED CONTROL

In automatic fan speed control mode, fan speed automatically varies with temperature and without CPU intervention, once initial parameters are set up. The advantage of this is that when a system hangs, the user is guaranteed that the system is protected from overheating. The automatic fan speed control incorporates a feature called dynamic T_{MIN} calibration. This feature reduces the design effort required to program the automatic fan speed control loop. For more information and how to program the automatic fan speed control loop and dynamic T_{MIN} calibration, see Application Note AN-613, Programming the Automatic Fan Speed Control Loop.

Table 22. Register 0x20 to Register 0x29. Temperature Reading Registers (Power-On Default = 0x00)

Register Address	Read/Write	Description
0x20	Read-only	Temperature 1 Reading (from TMP05 sensor)
0x21	Read-only	Temperature 2 Reading (from TMP05 sensor)
0x22	Read-only	Temperature 3 Reading (from TMP05 sensor)
0x23	Read-only	Temperature 4 Reading (from TMP05 sensor)
0x24	Read-only	Temperature 5 Reading (from TMP05 sensor)
0x25	Read-only	Temperature 6 Reading (from TMP05 sensor)
0x26	Read-only	Temperature 7 Reading (from TMP05 sensor)
0x27	Read-only	Temperature 8 Reading (from TMP05 sensor)
0x28	Read-only	Temperature 9 Reading (from TMP05 sensor)
0x29	Read-only	Temperature 10 Reading (from TMP05 sensor)

Readings from daisy-chained TMP05s are processed and loaded into the temperature reading registers.

Table 23. Register 0x2A to Register 0x31. Fan Tach Reading Registers (Power-On Default = 0x00)

Register Address	Read/Write	Description
0x2A	Read-only	Tach 1 Low Byte (8 MSBs of reading)
0x2B	Read-only	Tach 1 High Byte (8 LSBs of reading)
0x2C	Read-only	Tach 2 High Byte (8 MSBs of reading)
0x2D	Read-only	Tach 2 Low Byte (8 LSBs of reading)
0x2E	Read-only	Tach 3 High Byte (8 MSBs of reading)
0x2F	Read-only	Tach 3 Low Byte (8 LSBs of reading)
0x30	Read-only	Tach 4 High Byte (8 MSBs of reading)
0x31	Read-only	Tach 4 Low Byte (8 LSBs of reading)

The fan tach reading registers count the number of 11.11 µs periods (based on an internal 90 kHz clock) that occur between a number of consecutive fan tach pulses (default = 2). The number of tach pulses used to count can be changed using the fan pulses per revolution register (Register 0x43). This allows the fan speed to be accurately measured. Because a valid fan tachometer reading requires that two bytes are read, the low byte MUST be read first. Both the low and high bytes are then frozen until read. At power-on, these registers contain 0x0000 until such time as the first valid fan tach measurement is read in to these registers. This prevents false interrupts from occurring while the fans are spinning up.

A count of 0xFFFF indicates that a fan is

- Stalled or blocked (object jamming the fan).
- Failed (internal circuitry destroyed).
- Not populated (the ADT7470 expects to see a fan connected to each tach. If a fan is not connected to that tach, its tach minimum high and low byte should be set to 0xFFFF).

Table 24. Register 0x32 to Register 0x35. Current PWM Duty Cycle Registers (Power-On Default = 0xFF)

Register Address	Read/Write	Description
0x32	Read/Write	PWM1 Current Duty Cycle (0% to 100% duty cycle = 0x00 to 0xFF)
0x33	Read/Write	PWM2 Current Duty Cycle (0% to 100% duty cycle = 0x00 to 0xFF)
0x34	Read/Write	PWM3 Current Duty Cycle (0% to 100% duty cycle = 0x00 to 0xFF)
0x35	Read/Write	PWM4 Current Duty Cycle (0% to 100% duty cycle = 0x00 to 0xFF)

The current PWM duty cycle registers reflect the PWM duty cycle driving each fan at any given time. When in automatic fan speed control mode, the ADT7470 reports the PWM duty cycles back through these registers. The PWM duty cycle values vary according to temperature in sutomatic fan speed control mode. During fan startup, these registers report back 0x00. In software mode, the PWM duty cycle outputs can be set to any duty cycle value by writing to these registers.

Table 25. Register 0x36. Fans Not Present Register (Power-On Default = 0x00)

Register Address	Read/Write	Description
0x36	Read	Fans Not Present Register. The TEST bit in the Configuration Register (Register 0x40) invokes a fan freewheeling test to determine how many fans are connected to the part. The results of the fan test are reflected in the fans not present register.
<0> Fan 1	Read	A 1 indicates that Fan 1 is not present.
<1> Fan 2	Read	A 1 indicates that Fan 2 is not present.
<2> Fan 3	Read	A 1 indicates that Fan 3 is not present.
<3> Fan 4	Read	A 1 indicates that Fan 4 is not present.
<4:7> Reserved	Read	Unused.

Table 26. Register 0x3D. Device ID Register (Power-On Default = 0x70)

Register Address	Read/Write	Description
0x3D	Read/Write	Device ID.

The device ID register contains the ADT7470 device ID value as a means of identifying the part over the bus.

Table 27. Register 0x3E. Company ID Register (Power-On Default = 0x41)

Register Address	Read/Write	Description
0x3E	Read/Write	Company ID.

The company ID register contains the "0x41", the manufacturer ID number representative of Analog Devices product.

Table 28. Register 0x3F. Revision Register (Power-On Default = xxH)

Register Address	Read/Write	Description
0x3F	Read/Write	Revision Register

The revision register contains the stepping number and version of the product.

Table 29. Register 0x40. Configuration Register 1 (Power-On Default = 0x00)

Bit Name	Read/Write	Description
<0> STRT	Read/Write	Logic 1 enables monitoring and PWM control outputs based on the limit settings programmed. Logic 0 disables monitoring and PWM control based on the default power-up limit settings. Note that the limit values programmed are preserved even if a Logic 0 is written to this bit and the default settings are enabled.
<1> TEST	Read/Write	Logic 1 invokes a fan free-wheeling test by running all four PWM outputs at 100% for x seconds and monitors the fans using the tach inputs. If any of the fans are not present, then the individual fan bits in the fans not present register is set.
<2> FSPD	Read/Write	Writing a 1 drives the PWM outputs to 100% for software control.
<3> TODIS	Read/Write	Writing a 1 enables SMBus timeout.
<4> LOCK	Write Once	Once this bit is set, all lockable registers become read-only and cannot be modified until the ADT7470 is powered down and powered up again.
<5> FST_TCH	Read/Write	Enable Fast Tach.
<6> HF_LF	Read/Write	This bit switches between high frequency and low frequency fan drive. 0 = Default = High Frequency Fan Drive (1.4 kHz or 22.5 kHz - see Configuration Register 2, Register 0x74, Bits <6:4>) in Table 41. 1 = Low Frequency FanDrive (frequency determined by Configuration Register 2, Register 0x74, Bits <6:4>) in Table 41.
<7> T05_STB	Read/Write	Select configuration for Pin 13. 0 = Default = full_speedb input. 1 = TMP05 start pulse output.

Table 30. Register 0x41. Interrupt Status Register 1 (Power On Default = 00H)

Bit Name	Read/Write	Description
<0> R1T	Read-only	A 1 indicates that the Remote 1 temperature high or low limit has been exceeded. This bit is cleared on a read of the status register only if the error condition has subsided.
<1> R2T	Read-only	A 1 indicates that the Remote 2 temperature high or low limit has been exceeded. This bit is cleared on a read of the status register only if the error condition has subsided.
<2> R3T	Read-only	A 1 indicates that the Remote 3 temperature high or low limit has been exceeded. This bit is cleared on a read of the status register only if the error condition has subsided.
<3> R4T	Read-only	A 1 indicates that the Remote 4 temperature high or low limit has been exceeded. This bit is cleared on a read of the status register only if the error condition has subsided.
<4> R5T	Read-only	A 1 indicates that the Remote 5 temperature high or low limit has been exceeded. This bit is cleared on a read of the status register only if the error condition has subsided.
<5> R6T	Read-only	A 1 indicates that the Remote 6 temperature high or low limit has been exceeded. This bit is cleared on a read of the status register only if the error condition has subsided.
<6> R7T	Read-only	A 1 indicates that the Remote 7 temperature high or low limit has been exceeded. This bit is cleared on a read of the status register only if the error condition has subsided.
<7> OOL	Read-only	A 1 indicates that an out-of-limit event has been latched in Status Register 2. This bit is a logical OR of all status bits in Status Register 2. Software can test this bit in isolation to determine whether any of the temperature or fan speed readings represented by Status Register 2 are out-of-limit. This saves the need to read Status Register 2 every interrupt or polling cycle.

Table 31. Register 0x42. Interrupt Status Register 2 (Power-On Default = 0x00)

Bit Name	Read/Write	Description
<0> R8T	Read-only	A 1 indicates that the Remote 8 temperature high or low limit has been exceeded. This bit is cleared on a read of the status register only if the error condition has subsided.
<1> R9T	Read-only	A 1 indicates that the Remote 9 temperature high or low limit has been exceeded. This bit is cleared on a read of the status register only if the error condition has subsided.
<2> R10T	Read-only	A 1 indicates that the Remote 10 temperature high or low limit has been exceeded. This bit is cleared on a read of the status register only if the error condition has subsided.
<3> NORM	Read-only	A 1 indicates that the measured temperatures are normal (below T_{MIN}) and that the fans are supposed to be off.
<4> Fan 1	Read-only	A 1 indicates that Fan 1 has gone above max speed, dropped below min speed, or has stalled. This bit is not set when the PWM 1 output is off.
<5> Fan 2	Read-only	A 1 indicates that Fan 2 has gone above max speed, dropped below min speed, or has stalled. This bit is not set when the PWM 2 output is off.
<6> Fan 3	Read-only	A 1 indicates that Fan 3 has gone above max speed, dropped below min speed, or has stalled. This bit is not set when the PWM 3 output is off.
<7> Fan 4	Read-only	A 1 indicates that Fan 4 has gone above max speed, dropped below min speed, or has stalled. This bit is not set when the PWM 4 output is off.

Table 32. Register 0x43. Fan Pulses Per Revolution Register (Power On Default = 0x55)

Bit Name	Read/Write	Description
<1:0> Fan 1	Read/Write	Sets the number of pulses to be counted when measuring Fan 1 speed. Can be used to determine fan's pulses per revolution number for unknown fan type. **Pulses Counted** 00 = 1 01 = 2 (default) 10 = 3 11 = 4
<3:2> Fan 2	Read/Write	Sets the number of pulses to be counted when measuring Fan 2 speed. Can be used to determine fan's pulses per revolution number for unknown fan type. **Pulses Counted** 00 = 1 01 = 2 (default) 10 = 3 11 = 4
<5:4> Fan 3	Read/Write	Sets the number of pulses to be counted when measuring Fan 3 speed. Can be used to determine fan's pulses per revolution for unknown fan type. **Pulses Counted** 00 = 1 01 = 2 (default) 10 = 3 11 = 4
<7:6> Fan 4	Read/Write	Sets the number of pulses to be counted when measuring Fan 4 speed. Can be used to determine fan's pulses per revolution for unknown fan type. **Pulses Counted** 00 = 1 01 = 2 (default) 10 = 3 11 = 4

Table 33. Register 0x44 to Register 0x57. Temperature Limit Registers

Register Address	Read/Write	Description	Power-On Default
0x44	Read/Write	Temperature 1 Low Limit	0x81
0x45	Read/Write	Temperature 1 High Limit	0x7F
0x46	Read/Write	Temperature 2 Low Limit	0x81
0x47	Read/Write	Temperature 2 High Limit	0x7F
0x48	Read/Write	Temperature 3 Low Limit	0x81
0x49	Read/Write	Temperature 3 High Limit	0x7F
0x4A	Read/Write	Temperature 4 Low Limit	0x81
0x4B	Read/Write	Temperature 4 High Limit	0x7F
0x4C	Read/Write	Temperature 5 Low Limit	0x81
0x4D	Read/Write	Temperature 5 High Limit	0x7F
0x4E	Read/Write	Temperature 6 Low Limit	0x81
0x4F	Read/Write	Temperature 6 High Limit	0x7F
0x50	Read/Write	Temperature 7 Low Limit	0x81
0x51	Read/Write	Temperature 7 High Limit	0x7F
0x52	Read/Write	Temperature 8 Low Limit	0x81
0x53	Read/Write	Temperature 8 High Limit	0x7F
0x54	Read/Write	Temperature 9 Low Limit	0x81
0x55	Read/Write	Temperature 9 High Limit	0x7F
0x56	Read/Write	Temperature 10 Low Limit	0x81
0x57	Read/Write	Temperature 10 High Limit	0x7F

Exceeding any of these temperature limits by 1°C causes the appropriate status bit to be set in the interrupt status registers.

High Limits: An interrupt is generated when a value exceeds its high limit (> comparison).
Low Limits: An interrupt is generated when a value is equal to or below its low limit (≤ comparison).

Table 34. Register 0x58 to Register 0x67. Fan Tachometer Limit Registers

Register Address	Read/Write	Description	Power-On Default
0x58	Read/Write	Tach 1 Min Low Byte	0xFF
0x59	Read/Write	Tach 1 Min High Byte	0xFF
0x5A	Read/Write	Tach 2 Min Low Byte	0xFF
0x5B	Read/Write	Tach 2 Min High Byte	0xFF
0x5C	Read/Write	Tach 3 Min Low Byte	0xFF
0x5D	Read/Write	Tach 3 Min High Byte	0xFF
0x5E	Read/Write	Tach 4 Min Low Byte	0xFF
0x5F	Read/Write	Tach 4 Min High Byte	0xFF

0x66	Read/Write	Tach 4 Max Low Byte	0x00
0x67	Read/Write	Tach 4 Max High Byte	0x00

Exceeding any of the tach min limit registers by 1 indicates that the fan is running too slowly or has stalled. The appropriate status bit is set in Interrupt Status Register 2 to indicate the fan failure.
Exceeding any of the tach max limit registers by 1 indicates that the fan is too fast. The appropriate status bit is set in Interrupt Status Register 2 to indicate the fan failure.

Table 35. Register 0x68. PWM1/PWM2 Configuration Register

Register Address	Read/Write	Description	Power-On Default
0x68	Read/Write	PWM1/PMW2 Configuration	0x00

Bit Name	Read/Write	Description
<0> FAIL2	Read/Write	Setting this bit to 1 causes all fans to spin 100% if Fan 2 fails.
<1> FAIL1	Read/Write	Setting this bit to 1 causes all fans to spin 100% if Fan 1 fails.
<2> OVT2	Read/Write	Setting this bit to 1 causes Fan 2 to spin 100% if any overtemperature condition occurs.
<3> OVT1	Read/Write	Setting this bit to 1 causes Fan 1 to spin 100% if any overtemperature condition occurs.
<4> INV2	Read/Write	Setting this bit to 1 inverts the PWM2 output (100% = logic low). Default = 0 drives the PWM2 output logic high for 100% duty cycle.
<5> INV1	Read/Write	Setting this bit to 1 inverts the PWM1 output (100% = logic low). Default = 0 drives the PWM1 output logic high for 100% duty cycle.
<6> BHVR2	Read/Write	This bit assigns fan behavior for PWM2 output. 0 = Manual fan control mode (PWM duty cycle controlled in software). 1 = Fastest speed calculated by all temperatures control PWM2 (automatic fan control mode).
<7> BHVR1	Read/Write	This bit assigns fan behavior for PWM1 output. 0 = Manual fan control mode (PWM duty cycle controlled in software). 1 = Fastest speed calculated by all temperatures control PWM1 (automatic fan control mode).

Table 36. Register 0x69. PWM3/PWM4 Configuration Register

Register Address	Read/Write	Description	Power-On Default
0x69	Read/Write	PWM3/PMW4 Configuration	0x00

Bit Name	Read/Write	Description
<0> FAIL4	Read/Write	Setting this bit to 1 causes all fans to spin 100% if Fan 4 fails.
<1> FAIL3	Read/Write	Setting this bit to 1 causes all fans to spin 100% if Fan 3 fails.
<2> OVT4	Read/Write	Setting this bit to 1 causes Fan 4 to spin 100% if any overtemperature condition occurs.
<3> OVT3	Read/Write	Setting this bit to 1 causes Fan 3 to spin 100% if any overtemperature condition occurs.
<4> INV4	Read/Write	Setting this bit to 1 inverts the PWM4 output (100% = logic low). Default = 0 drives the PWM4 output logic high for 100% duty cycle.
<5> INV3	Read/Write	Setting this bit to 1 inverts the PWM3 output (100% = logic low). Default = 0 drives the PWM3 output logic high for 100% duty cycle.
<6> BHVR4	Read/Write	This bit assigns fan behavior for PWM4 output. 0 = Manual fan control mode (PWM duty cycle controlled in software). 1 = Fastest speed calculated by all temperatures control PWM4 (automatic fan control mode).
<7> BHVR3	Read/Write	This bit assigns fan behavior for PWM3 output. 0 = Manual fan control mode (PWM duty cycle controlled in software). 1 = Fastest speed calculated by all temperatures control PWM3 (automatic fan control mode).

Table 37. Register 0x6A to Register 0x6D. PWM_{MIN} Duty Cycle Registers

Register Address	Read/Write	Description	Power-On Default
0x6A	Read/Write	PWM1 Min Duty Cycle	0x80 (50% duty cycle)
0x6B	Read/Write	PWM2 Min Duty Cycle	0x80 (50% duty cycle)
0x6C	Read/Write	PWM3 Min Duty Cycle	0x80 (50% duty cycle)
0x6D	Read/Write	PWM4 Min Duty Cycle	0x80 (50% duty cycle)

Bit Name	Read/Write	Description
<7:0> PWM Duty Cycle	Read/Write	These bits define the PWM_{MIN} duty cycle for PWMx. 0x00 = 0% duty cycle (fan off) 0x40 = 25% duty cycle 0x80 = 50% duty cycle 0xFF = 100% duty cycle (fan full-speed)

Registers 0x6A to 0x6D become read-only when the ADT7470 is in automatic fan control mode.

Table 38. Register 0x6E to Register 0x71. T_{MIN} Registers

Register Address	Read/Write	Description	Power-On Default
0x6E	Read/Write	Temperature 1 T_{MIN}	0x5A (90°C)
0x6F	Read/Write	Temperature 2 T_{MIN}	0x5A (90°C)
0x70	Read/Write	Temperature 3 T_{MIN}	0x5A (90°C)
0x71	Read/Write	Temperature 4 T_{MIN}	0x5A (90°C)

These are the T_{MIN} registers for each temperature channel. When the temperature measured exceeds T_{MIN}, the appropriate fan run at minimum speed and increase with temperature according to $T_{MIN} + T_{RANGE}$.

Table 39. Register 0x72. Interrupt Mask Register 1 (Power-On Default <7:0> = 0x00)

Bit Name	Read/Write	Description
<6> R7T	Read/Write	A 1 masks the Temperature 7 value from generating an interrupt on the $\overline{\text{SMBALERT}}$ output. The R7T bit is set as normal in the status register for out-of-limit conditions.
<7> OOL	Read/Write	A 1 masks the OOL bit from generating an interrupt on the $\overline{\text{SMBALERT}}$ output. The OOL bit is set as normal in the status register for out-of-limit conditions.
<0> R7T	Read/Write	A 1 masks the Temperature 7 value from generating an interrupt on the $\overline{\text{SMBALERT}}$ output. The R1T bit is set as normal in the status register for out-of-limit conditions.
<1> R6T	Read/Write	A 1 masks the Temperature 6 value from generating an interrupt on the $\overline{\text{SMBALERT}}$ output. The R2T bit is set as normal in the status register for out-of-limit conditions.
<2> R5T	Read/Write	A 1 masks the Temperature 5 value from generating an interrupt on the $\overline{\text{SMBALERT}}$ output. The R3T bit is set as normal in the status register for out-of-limit conditions.
<3> R4T	Read/Write	A 1 masks the Temperature 4 value from generating an interrupt on the $\overline{\text{SMBALERT}}$ output. The R4T bit is set as normal in the status register for out-of-limit conditions.
<4> R3T	Read/Write	A 1 masks the Temperature 3 value from generating an interrupt on the $\overline{\text{SMBALERT}}$ output. The R5T bit is set as normal in the status register for out-of-limit conditions.
<5> R2T	Read/Write	A 1 masks the Temperature 2 value from generating an interrupt on the $\overline{\text{SMBALERT}}$ output. The R6T bit is set as normal in the status register for out-of-limit conditions.
<6> R1T	Read/Write	A 1 masks the Temperature 1 value from generating an interrupt on the $\overline{\text{SMBALERT}}$ output. The R7T bit is set as normal in the status register for out-of-limit conditions.

Table 40. Register 0x73. Interrupt Mask Register 2 (Power-On Default <7:0> = 0x00)

Bit Name	Read/Write	Description
<7> Fan 4	Read/Write	A 1 masks the Fan 4 value from generating an interrupt on the $\overline{\text{SMBALERT}}$ output. The Fan 4 bit is set as normal in the status register for out-of-limit conditions.
<6> Fan 3	Read/Write	A 1 masks the Fan 3 value from generating an interrupt on the $\overline{\text{SMBALERT}}$ output. The Fan 3 bit is set as normal in the status register for out-of-limit conditions.
<5> Fan 2	Read/Write	A 1 masks the Fan 2 value from generating an interrupt on the $\overline{\text{SMBALERT}}$ output. The Fan 2 bit is set as normal in the status register for out-of-limit conditions.
<4> Fan 1	Read/Write	A 1 masks the Fan 1 value from generating an interrupt on the $\overline{\text{SMBALERT}}$ output. The Fan 1 bit is set as normal in the status register for out-of-limit conditions.
<3> NORM	Read/Write	A 1 masks the NORM bit from generating an interrupt on the $\overline{\text{SMBALERT}}$ output. The NORM bit is set as normal in the status register for out-of-limit conditions.
<2> R10T	Read/Write	A 1 masks the Temperature 10 value from generating an interrupt on the $\overline{\text{SMBALERT}}$ output. The R10T bit is set as normal in the status register for out-of-limit conditions.
<1> R9T	Read/Write	A 1 masks the Temperature 9 value from generating an interrupt on the $\overline{\text{SMBALERT}}$ output. The R9T bit is set as normal in the status register for out-of-limit conditions.
<0> R8T	Read/Write	A 1 masks the Temperature 8 value from generating an interrupt on the $\overline{\text{SMBALERT}}$ output. The R8T bit is set as normal in the status register for out-of-limit conditions.

Table 41. Register 0x74. Configuration Register 2 (Power-On Default = 0x00)

Bit Name	Read/Write	Description		
<7> SHDN	Read/Write	Shutdown/low current mode.		
<6:4> FREQ	Read/Write	These bits control PWM1–4 frequency when the fan drive is configured as a low frequency drive.		
		Register 0x74<6:4>	**Register 0x40<6> = 1**	**Register 0x40<6> = 0**
		000	11.0 Hz	1.4 kHz
		001	14.7 Hz	22.5 kHz
		010	22.1 Hz	22.5 kHz
		011	29.4 Hz	22.5 kHz
		100	35.3 Hz	22.5 kHz
		101	44.1 Hz	22.5 kHz
		110	58.8 Hz	22.5 kHz
		111	88.2 Hz	22.5 kHz
<3> T4_dis	Read/Write	Writing a 1 disables Tach 4 pulses.		
<2> T3_dis	Read/Write	Writing a 1 disables Tach 3 pulses.		
<1> T2_dis	Read/Write	Writing a 1 disables Tach 2 pulses.		
<0> T1_dis	Read/Write	Writing a 1 disables Tach 1 pulses.		

Table 42. Register 0x75. Enhance Acoustics 1 (Power-On Default = 0x00)

Bit Name	Read/Write	Description	
<7> EN1	Read/Write	When this bit is 1, acoustic enhancement is enabled on PWM1 output.	
<6:4> ACOU1	Read/Write	These bits select the ramp rate applied to the PWM1 output. Instead of PWM1 jumping instantaneously to its newly calculated speed, PWM1 ramps gracefully at the rate determined by these bits. This effects the acoustics of the fans being driven by the PWM1 output.	
		Time Slot	**Increase Time for 33% to 100%**
		000 = 1	35 s
		001 = 2	17.6 s
		010 = 3	11.8 s
		011 = 5	7 s
		100 = 8	4.4 s
		101 = 12	3 s
		110 = 24	1.6 s
		111 = 48	0.8 s
<3> EN2	Read/Write	When this bit is 1, acoustic enhancement is enabled on PWM2 output.	
<2:0> ACOU2	Read/Write	These bits select the ramp rate applied to the PWM2 output. Instead of PWM2 jumping instantaneously to its newly calculated speed, PWM2 ramps gracefully at the rate determined by these bits. This effects the acoustics of the fans being driven by the PWM2 output.	
		Time Slot	**Increase Time for 33% to 100%**
		000 = 1	35 s
		001 = 2 17	6 s
		010 = 3	11.8 s
		011 = 5	7 s
		100 = 8	4.4 s
		101 = 12	3 s
		110 = 24	1.6 s
		111 = 48	0.8 s

Table 43. Register 0x76. Enhance Acoustics 2 (Power-On Default = 0x00)

Bit Name	Read/Write	Description
<7> EN3	Read/Write	When this bit is 1, acoustic enhancement is enabled on PWM3 output.
<6:4> ACOU3	Read/Write	These bits select the ramp rate applied to the PWM3 output. Instead of PWM3 jumping instantaneously to its newly calculated speed, PWM3 ramps gracefully at the rate determined by these bits. This effects the acoustics of the fans being driven by the PWM3 output. **Time Slot** — **Increase Time for 33% to 100%** 000 = 1 — 35 s 001 = 2 — 17.6 s 010 = 3 — 11.8 s 011 = 5 — 7 s 100 = 8 — 4.4 s 101 = 12 — 3 s 110 = 24 — 1.6 s 111 = 48 — 0.8 s
<3> EN4	Read/Write	When this bit is 1, acoustic enhancement is enabled on PWM4 output.
<2:0> ACOU4	Read/Write	These bits select the ramp rate applied to the PWM4 output. Instead of PWM4 jumping instantaneously to its newly calculated speed, PWM4 ramps gracefully at the rate determined by these bits. This effects the acoustics of the fans being driven by the PWM4 output. **Time Slot** — **Increase Time for 33% to 100%** 000 = 1 — 35 s 001 = 2 — 17.6 s 010 = 3 — 11.8 s 011 = 5 — 7 s 100 = 8 — 4.4 s 101 = 12 — 3 s 110 = 24 — 1.6 s 111 = 48 — 0.8 s

Table 44. Register 0x78. Max TMP05 Temperature (Power-On Default = 0x00)

Bit Name	Read/Write	Description
<7:0> TMP05_MAX	Read	This is a read-only register that indicates the maximum of all TMP05 temperatures.

Table 45. Register 0x79. TMP05 COEF Option 1 (Power-On Default = 0x00)

Bit Name	Read/Write	Description
<7:0> TMP05_GAIN<9:2>	Read/Write	This register contains Bits 9–2 of the optional TMP05 gain coefficient.

Table 46. Register 0x7A. TMP05 COEF Option 2 (Power-On Default = 0x00)

Bit Name	Read/Write	Description
<7:6> TMP05_GAIN<1:0>	Read/Write	These bits contain Bits 1–0 of the optional TMP05 gain coefficient.
<5:0> TMP05_OFFS<8:3>	Read/Write	These bits contain Bits 8–3 of the optional TMP05 offset coefficient. See also Register 0x7B in the next table.

Table 47. Register 0x7B. TMP05 COEF Option 3 (Power-On Default = 0x00)

Bit Name	Read/Write	Description	
<7:5> TMP05_OFFS	Read/Write	These bits contain Bits 2–0 of the optional TMP05 offset coefficient.	
<2:0> AFC_Spin_Up	Read/Write	These bits control the AFC fan spin-up .	
		Programming	**Setting**
		000	No Start Up (Default)
		001	100 msec
		010	250 msec
		011	400 msec
		100	667 msec
		101	1 sec
		110	2 sec
		111	4 sec

Table 48. Register 0x7C. TMP05 Zone Select 1 (Power-On Default = 0x00)

Bit Name	Read/Write	Description	
<7:4> zone_fan1<3:0>	Read/Write	These bits determine which temperature zone controls Fan 1.	
		zone_fan1<3:0>	**Description**
		0000	Max_temperature from Register 0x78 controls Fan 1.
		0001	Temperature 1 from Register 0x20 controls Fan 1.
		0010	Temperature 2 from Register 0x21 controls Fan 1.
		0011	Temperature 3 from Register 0x22 controls Fan 1.
		0100	Temperature 4 from Register 0x23 controls Fan 1.
		0101	Temperature 5 from Register 0x24 controls Fan 1.
		0110	Temperature 6 from Register 0x25 controls Fan 1.
		0111	Temperature 7 from Register 0x26 controls Fan 1.
		1000	Temperature 8 from Register 0x27 controls Fan 1.
		1001	Temperature 9 from Register 0x28 controls Fan 1.
		1010	Temperature 10 from Register 0x29 controls Fan 1.
<3:0> zone_fan2<3:0>	Read/Write	These bits determine which temperature zone controls Fan 2.	
		zone_fan2<3:0>	**Description**
		0000	max_temperature from Register 0x78 controls Fan 2.
		0001	Temperature 1 from Register 0x20 controls Fan 2.
		0010	Temperature 2 from Register 0x21 controls Fan 2.
		0011	Temperature 3 from Register 0x22 controls Fan 2.
		0100	Temperature 4 from Register 0x23 controls Fan 2.
		0101	Temperature 5 from Register 0x24 controls Fan 2.
		0110	Temperature 6 from Register 0x25 controls Fan 2.
		0111	Temperature 7 from Register 0x26 controls Fan 2.
		1000	Temperature 8 from Register 0x27 controls Fan 2.
		1001	Temperature 9 from Register 0x28 controls Fan 2.
		1010	Temperature 10 from Register 0x29 controls Fan 2.

Table 49. Register 0x7D. TMP05 Zone Select 2 (Power-On Default = 0x00)

Bit Name	Read/Write	Description	
<7:4> zone_fan3<3:0>	Read/Write	These bits determine which temperature zone controls Fan 3.	
		zone_fan3<3:0>	**Description**
		0000	max_temperature from Register 0x78 controls Fan 3.
		0001	Temperature 1 from Register 0x20 controls Fan 3.
		0010	Temperature 2 from Register 0x21 controls Fan 3.
		0011	Temperature 3 from Register 0x22 controls Fan 3.
		0100	Temperature 4 from Register 0x23 controls Fan 3.
		0101	Temperature 5 from Register 0x24 controls Fan 3.
		0110	Temperature 6 from Register 0x25 controls Fan 3.
		0111	Temperature 7 from Register 0x26 controls Fan 3.
		1000	Temperature 8 from Register 0x27 controls Fan 3.
		1001	Temperature 9 from Register 0x28 controls Fan 3.
		1010	Temperature 10 from Register 0x29 controls Fan 3.
<3:0> zone_fan4<3:0>	Read/Write	These bits determine which temperature zone controls Fan 4.	
		zone_fan4<3:0>	**Description**
		0000	max_temperature from Register 0x78 controls Fan 4.
		0001	Temperature 1 from Register 0x20 controls Fan 4.
		0010	Temperature 2 from Register 0x21 controls Fan 4.
		0011	Temperature 3 from Register 0x22 controls Fan 4.
		0100	Temperature 4 from Register 0x23 controls Fan 4.
		0101	Temperature 5 from Register 0x24 controls Fan 4.
		0110	Temperature 6 from Register 0x25 controls Fan 4.
		0111	Temperature 7 from Register 0x26 controls Fan 4.
		1000	Temperature 8 from Register 0x27 controls Fan 4.
		1001	Temperature 9 from Register 0x28 controls Fan 4.
		1010	Temperature 10 from Register 0x29 controls Fan 4.

Table 50. Register 0x7E. TMP05 COEF Select 1 (Power-On Default = 0x00)

Bit Name	Read/Write	Description
<7:0> coef_sel<9:2>	Read/Write	These bits determine whether the default TMP05 (coef_sel<x> = 0) coefficients are used, or whether the optional coefficients (0x79 to 0x7B) are used (coef_sel<x> = 1)

Table 51. Register 0x7F. TMP05 COEF Select 2 (Power-On Default = 0x00)

Bit Name	Read/Write	Description
<7:6> coef_sel<1:0>	Read/Write	These bits determine whether the default TMP05 (coef_sel<x> = 0) coefficients are used, or whether the optional coefficients (0x79 to 0x7B) are used (coef_sel<x> = 1).
<5:4>reserved	Read/Write	Reserved. This bit should be set to 0.
<3> GPIO1_en	Read/Write	PWM1 becomes a GPIO.
<2> GPIO2_en	Read/Write	PWM2 becomes a GPIO.
<1> GPIO3_en	Read/Write	PWM3 becomes a GPIO.
<0> GPIO4_en	Read/Write	PWM4 becomes a GPIO.

Table 52. Register 0x80. GPIO CONFIG (Power-On Default = 0x00)

Bit Name	Read/Write	Description
<7> GPIO1_d	Read/Write	This bit sets the direction of GPIO 1 when the PWM1 pin is configured as GPIO) 1= Output; 0 = Input. Data for GPIO 1 is set by the LSB of the PWM1 min duty cycle register.
<6> GPIO1_p	Read/Write	This bit sets the polarity of GPIO 1 when the PWM1 pin is configured as GPIO. 1 = Active High; 0 = Active Low.
<5> GPIO2_d	Read/Write	This bit sets the direction of GPIO 2 when the PWM2 pin is configured as GPIO. 1= Output; 0 = Input. Data for GPIO 2 is set by the LSB of the PWM2 min duty cycle register.
<4> GPIO2_p	Read/Write	This bit sets the polarity of GPIO 2 when the PWM2 pin is configured as GPIO. 1 = Active High; 0 = Active Low
<3> GPIO3_d	Read/Write	This bit sets the direction of GPIO 3 when the PWM3 pin is configured as GPIO. 1= Output; 0 = Input. Data for GPIO 3 is set by the LSB of the PWM3 min duty cycle register.
<2> GPIO3_p	Read/Write	This bit sets the polarity of GPIO 3 when the PWM3 pin is configured as GPIO. 1 = Active High; 0 = Active Low.
<1> GPIO4_d	Read/Write	This bit sets the direction of GPIO 4 when the PWM4 pin is configured as GPIO. 1= Output; 0 = Input. Data for GPIO 4 is set by the LSB of the PWM4 min duty cycle register.
<0> GPIO4_p	Read/Write	This bit sets the polarity of GPIO 4 when the PWM4 pin is configured as GPIO. 1 = Active High; 0 = Active Low.

Table 53. Register 0x81. GPIO Status (Power-On Default = 0x00)

Bit Name	Read/Write	Description
<7:4> GPIO_s	Read/Write	These bit indicates the status of the GPIO when the corresponding PWM pin is configured as GPIO. When GPIO is configured as an input, these bits are read-only. They are set when the input is asserted. (Asserted can be high or low depending on the setting of the GPIO poliarity.) When GPIO is configured as an output, these bits are read/write. Setting these bits asserts the GPIO output. (Asserted can be high or low depending on the setting of GPIO4 poliarity). See Register 0x36<7:0> (Table 25).
<7> GPIO4_s	Read/Write	This bit indicates the status of GPIO 4 when the PWM4 pin is configured as GPIO.
<6> GPIO3_s	Read/Write	This bit indicates the status of GPIO 3 when the PWM3 pin is configured as GPIO.
<5> GPIO2_s	Read/Write	This bit indicates the status of GPIO 2 when the PWM2 pin is configured as GPIO.
<4> GPIO1_s	Read/Write	This bit indicates the status of GPIO 1 when the PWM1 pin is configured as GPIO.
<3:0> Reserved	Read/Write	Test Bit. For ADI use only.
