

## AMC2950/2951

### 100mA LOW DROPOUT VOLTAGE REGULATOR

DESCRIPTION	FEATURES
<p>The AMC2950/2951 series is a low power voltage regulator. This device is an excellent choice for use in battery powered applications such as notebook computers, radio control system and cordless telephone.</p> <p>The AMC2950/2951 features very low quiescent current (75µA typ.) and very low dropout voltage (typ. 40mV at light loads and 380mV at 100mA). This makes the AMC2950/2951 ideal as a precision voltage reference.</p> <p>The AMC2951 can be pin-strapped for a fixed output voltage of 3.3V or 5.0V, depending on the version, or programmed from 1.24V to 29V with an external pair of resistors. The Error Flag feature is used as power-on reset for warning of a low output voltage. Other feature is the logic-compatible shutdown input turns on and off the regulator output voltage.</p>	<ul style="list-style-type: none"> <li>■ Very low quiescent current</li> <li>■ 5V and 3.3V output voltages available</li> <li>■ Output programmable from 1.24V to 29V by external pair of resistors</li> <li>■ High accuracy output voltage</li> <li>■ Output current of 100mA</li> <li>□ Needs minimum capacitance for stability</li> <li>□ Low dropout voltage</li> <li>□ Extremely tight load and line regulation</li> <li>□ Error Flag warns of output dropout</li> <li>□ Logic-controlled shutdown</li> <li>□ Pin assignment identical to earlier LP2950/2951 series.</li> </ul>

APPLICATIONS	PACKAGE PIN OUT
--------------	-----------------

- Voltage Reference
- Portable/ Notebook Computers
- Battery Powered Systems
- Radio Control System
- Cordless Telephones
- Portable Consumer Equipment

**AMC2950**

## VOLTAGE REGULATORS

### BLOCK DIAGRAM

**AMC2950**

**AMC2951**

### ABSOLUTE MAXIMUM RATINGS (Note 1)

Input Supply Voltage	-0.3V to 30V
Feedback Input Voltage	-0.3V to 30V
Error Flag Output	-0.3V to 30V
Operating Junction Temperature Range, $T_J$	0°C to 150°C
Storage Temperature Range	-65°C to 150°C
Lead Temperature (soldering, 10 seconds)	260°C

Note 1: Exceeding these ratings could cause damage to the device. All voltages are with respect to Ground. Currents are positive into, negative out of the specified terminal.

## 100mA LOW DROPOUT VOLTAGE REGULATORS

ELECTRICAL CHARACTERISTICS							
Unless otherwise specified, these specifications apply the operating ambient temperatures with $T_A = 25^\circ\text{C}$ . $V_{IN} = V_{OUT} + 1\text{V}$ , $I_L = 100\mu\text{A}$ , and $C_L = 1\mu\text{F}$ for 5V version and $2.2\mu\text{F}$ for 3.3V version. Additional conditions for the 8-pin version are FEEDBACK connected to V TAP, OUTPUT connected to SENSE, and SHUTDOWN $\leq 0.8\text{V}$ .							
Parameter	Symbol	Test Conditions	AMC2950/2951			Units	
			Min	Typ	Max		
Output Voltage	AMC2950-3.3	$V_{OUT}$	$0^\circ\text{C} \leq T_J \leq 85^\circ\text{C}$	3.251	3.300	3.350	mV
	AMC2951-3.3						
	AMC2950-5.0			4.925	5.000	5.075	
	AMC2951						
Output Voltage	AMC2950-3.3	$V_{OUT}$	$100\mu\text{A} \leq I_L \leq 100\text{mA}$ $0^\circ\text{C} \leq T_J \leq 85^\circ\text{C}$	3.221	3.300	3.379	mV

		$V_{SHUTDOWN} = 30\text{V}$		450	600	$\mu\text{A}$
Regulator Output Current in Shutdown		Note 8		3	10	$\mu\text{A}$

Note 2: Output or reference voltage temperature coefficients defined as the worst case voltage change divided by the total temperature range.

Note 3: Regulation is measured at constant junction temperature using pulse testing with a low duty cycle. Changes in output voltage due to heating effects are covered under the specification for thermal regulation.

Note 4: Dropout voltage is defined as the input to output differential at which the output voltage drops 100mV below its nominal value measured at 1V differential. At very low values of programmed output voltage, the minimum input supply voltage of 2V (2.3V over temperature) must be taken into account

Note 5: These parameters, although guaranteed, are not tested in production.

Note 6: Thermal regulation is defined as the change in output voltage at a time T after a change in power dissipation is applied, excluding load or line regulation effects. Specifications are for a 50mA load pulse at  $V_{IN} = 30\text{V}$  (1.25W pulse) for  $T = 10\text{ms}$ .

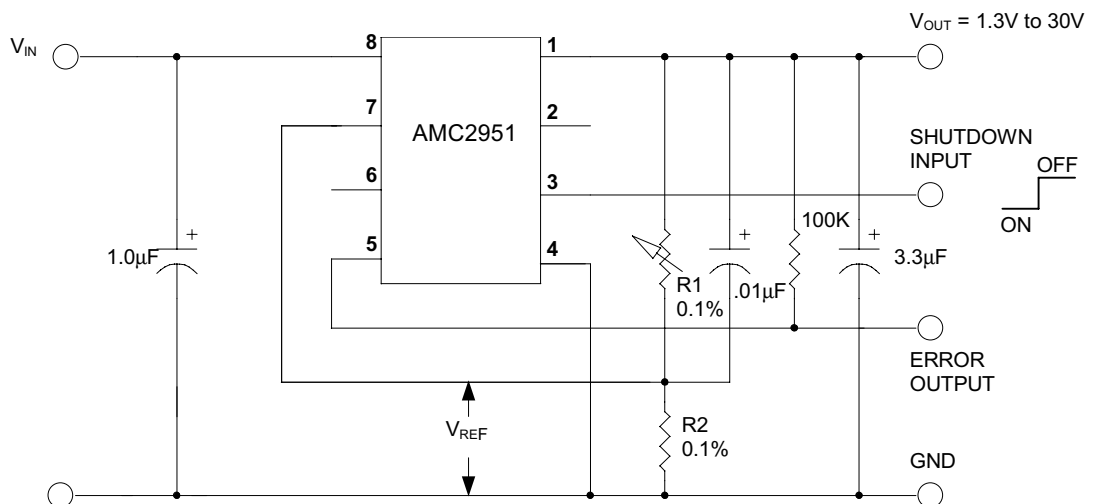

Note 7: Comparator thresholds are expressed in terms of a voltage differential at the feedback terminal below the nominal reference voltage measured at  $V_{IN} = V_{OUT} + 1\text{V}$ . To express these thresholds in terms of output voltage change, multiply by the error amplifier gain =  $V_{OUT}/V_{REF} = (R1 + R2)/R2$ . For example, at a programmed output voltage of 5V, the Error output is guaranteed to go low when the output drops by  $95\text{mV} \times 5\text{V}/1.235\text{V} = 384\text{mV}$ . Thresholds remain constant as a percent of  $V_{OUT}$  as  $V_{OUT}$  is varied, with the dropout warning occurring at typically 5% below nominal, 7.5% guaranteed.

Note 8:  $V_{SHUTDOWN} \geq 2\text{V}$ ,  $V_{IN} = 30\text{V}$ ,  $V_{OUT} = 0$ , Feedback connected to  $V_{TAP}$

**APPLICATION INFORMATION**

**Figure 1. AMC2951-X.X for fixed output application**

**Figure 2. AMC2951 for adjustable output application**

The AMC2951 may be pin-strapped for the nominal fixed output voltage with the internal voltage divider by connecting the OUTPUT and SENSE pins together, and also connecting the FEEDBACK and VTAP pins together.

For the adjustable output voltage applications, the AMC2951 can be programmed for any output voltage between 1.235V and 30V by two external resistors. The output voltage follows the equation below:

$$V_{OUT} = V_{REF} \times \left( 1 + \frac{R_1}{R_2} \right) + I_{FB}R_1$$

Where  $V_{REF}$  is the reference voltage of 1.235V and  $I_{FB}$  is the feedback pin bias current, typically  $-20nA$ . The minimum recommended load current of  $1\mu A$  forces an upper limit of  $1.2M\Omega$  for  $R_2$ , if the regulator must work with no load.

$I_{FB}$  will introduce a 2% typical error in  $V_{OUT}$ , which can be eliminated by trimming  $R_1$  at room temperature. For better accuracy, choosing  $R_2 = 100K$  reduces this error to 0.17%.
