SINGLE CHIP KARAOKE LSI

This IC is single chip KARAOKE LSI for LD/CD player, Mini compo, VTR.

As built-in ADC/DAC, Sound Field Control and bass treble (DSP effect), Mic echo, and Vocal cancel, this IC constructs KARAOKE function.

FEATURES

- Built-in 3channel AD converter.
THD : -65dB S/N : 78dB (typ.)
Built-in Ope Amp for Pre-filter.
- Built-in 2channel DA converter.
THD : -85dB S/N : 93dB (typ.)
Built-in 3rd Analog filter.
- Input : 3 Analog channel, 1 Digital stereo port.
Digital Input format : MSB first 16, 18, 20bit effective data before change point of LRCK or I²S.
- Output : 2 Analog Output/1 Digital stereo port.
Digital Output format : MSB first 16, 20bit effective data before change point of LRCK or I²S.
- Built-in 64Kbit delay RAM.
- KARAOKE function
 - Mic echo or Sound field control : Delay time variable.
 - Vocal cancel : suppress vocal signal from stereo source.
 - Double Audio source : Digital input and Analog input (addition L-ch and R-ch)
 - Vocal change : According to Mic signal input or not input, effective vocal cancel or not effective vocal cancel.
 - Bass treble
- Package is QFP 44pins.

Weight : 1.07g (Typ.)

Block operating description

1. Operating Clock

Master clock (Input or oscillating XI terminal) is 768/512/384/256fs. These mode are selected by CKS terminal, and 256fs or 384fs, 768fs or 512fs select is auto detect by this IC.

But following internal synchronize mode can not use 384/768fs, can only use 256/512fs.

And DSP calculate steps don't concern master clock, but DA converter operating clock change by master clock. DAC is $\Sigma\text{-}\Delta$ modulation method and operates oversampling, If 256fs is selected, Oversampling ratio is 128fs and so became worse S/N, THD + N.

Table.1-1 Master clock select and DAC oversampling ratio.

CKS	MASTER CLOCK	DAC OVERSAMPLING RATIO
L	768fs	192fs
	512fs	256fs
H	384fs	192fs
	256fs	128fs

2. Digital Audio Input/Output

2.1 Synchronize mode

Data input/output Bit clock is selected internal synchronize or external synchronize by "SYNM1", "SYNM2". ($\mu\text{-COM}$ I/F bit)

Table.2-1-1 Synchronize mode and Input/Output Bit clock.

SYNM2	SYNM1	SYNCHRONIZE	BCKI	BCKO
0	0	internal	(*)	64fs (**)
0	1	external	32fs	BCKI
1	0	external	48fs	BCKI
1	1	external	64fs	BCKI

(*) Table 2-2-1 shown.

(**) Internal clock divider.

Input/Output channel clock (LRCKI, LRCKO) data is selected by μ -COM I/F. (RLS bit)

Table.2-1-2 Channel clock

RLS	OPERATE
0	LRCKI, LRCKO : "H" Level, L-ch data input/output
1	LRCKI, LRCKO : "L" Level, L-ch data input/output

2.2 Data Input format

Data input format is Table.2-2-1 and Fig.1.

Selecting use IBIT1 and IBIT2. (μ -COM I/F)

Table.2-2-1 Data input format

3. μ -COM I/F

3.1 Setting

μ -COM I/F setting is 4 items.

Command is variable length 16~26bits. (effective data before change point Latch pulse)

When command is 8bits unit, setting is LSB first.

In this case, not using LSB data is not effective.

All this IC's setting change at internal program cycle beginning, but without digital attenuator setting, please mute output signal at changing program setting.

So Coefficient setting and offset RAM writing is one word at a fs.

When many word change, please by careful.

3.2 Operating mode setting [MODE]

Please set these mode at voltage supply.

When $\overline{\text{RESET}}$ is "L", these data is clear.

- ADPD : ADC power down (H : power down)
- ADLIM : "L"
- LSM : Digital Attenuator soft mute time select (H : twice)
- RLS : Channel clock select (H : LRCK = "L" is L-ch data)
- SYNM1, 2 : DATA input/output synchronize clock select
- IBIT1, 2 : Input DATA format select
- OBIT1, 2 : Output DATA format select
- MONO : MONO DATA input select
- CHS : At MONO Setting, channel select, At stereo setting, zero detect setting

3.3 DSP setting [FUNC]

At $\overline{\text{RESET}}$ terminal is "L" level, these data is clear.

- DF1, 2 : SFC, Mic echo desimention ratio select
- VCS : Vocal cancel characteristic select
- EXTO : Expand output terminal OUTPUT DATA
- MUTE : OUTPUT mute ("H" : mute, ATT setting is hold)
- CTUP : Vocal change attack time select
- CTDW : Vocal change release time select
- CEF1 : "L"
- CEF2 : Vocal change effect select
- EM1, 2 : De-emphasis filter select
- EMS : De-emphasis filter block select

3.5 Coefficient, Offset RAM writing [CRAM]

Coefficient and offset RAM writing operate one word at a fs.

RAM is 128word x 18bit.

Delay RAM Address offset data format is as follows.

Detail setting, please show soft ware manual.

MAL [2 : 0] : Delay RAM setting select

DECI [2 : 0] : Decimation ratio select

DLOF [11 : 00] : Offset Address select

4. AD converter

Built-in Line input L-ch and R-ch AD converter, and Mic signal input AD converter.

Mic input signal convert Digital signal and DSP make digital echo signal.

Mic signal add this echo signal by LI, RI terminal or external Op-amp.

It is necessary to open LI and RI terminal at the using Op-amp. When not using AD converter, please short circuit interval each terminal MICI-LPFO1, AIL-LPFO2 and AIR-LPFO3.

5. DA converter

This is Σ - Δ modulation 1bit DA converter.

Built-in 3'rd Analog Filter.

It is possible to add analog through signal (LI and RI Terminal) at the output portion of DAC.

6. Timing

6.1 Reset Timing

At power supply, please set $\overline{\text{RESET}}$ terminal "L" level at one time.

Power ON Reset Timing is as follows.
