DESCRIPTION

The 74ALS563A is an octal transparent latch coupled to eight 3-State output devices. The two sections of the device are controlled independently by enable (E) and output enable (\overline{OE}) control gates.

The 74ALS563A is a complementary version of the 74ALS373 and has a broadside pinout configuration to facilitate PC board layout and allow easy interface with microprocessors.

The data on the D inputs is transferred to the latch outputs when the enable (E) input is High. The latch remains transparent to the data input while E is High, and stores the inverted data that is present one setup time before the High-to-Low enable transition.

The 74ALS564A is a complementary version of the 74ALS373 and has a broadside pinout configuration to facilitate PC board layout and allow easy interface with microprocessors.

It is an 8-bit edge triggered register coupled to eight 3-State output buffers. The two sections of the device are controlled independently by clock (CP) and output enable (\overline{OE}) control gates.

The register is fully edge triggered. The state of the D input, one setup time before the Low-to-High clock transition is transferred to the corresponding flip-flop's Q output.

The active-Low output enable (\overline{OE}) controls all eight 3-State buffers independent of the latch operation. When \overline{OE} is Low, latched or transparent data appears at the output.

When \overline{OE} is High, the outputs are in high impedance "off" state, which means they will neither drive nor load the bus.
