

# Flame Detection Amplifier Monolithic IC MM1217

## Outline

This IC is comprised of an operation amplifier, a comparator, and a reference power source. It is worthy of note that the input offset voltage and the input offset voltage temperature drift of this operation amplifier are one digit less than those of conventional products regardless of the single power supply. Formerly, offset voltage adjustment was required for flame detection using a thermocouple on gas appliances, but with this IC adjustment is not required.

Due to the single power supply, low current consumption, and low offset voltage, two batteries can be used for operation, making it appropriate for equipment that amplifies the very small signal of portable equipment.

## Features

### General

|                                            |                                                                                     |
|--------------------------------------------|-------------------------------------------------------------------------------------|
| 1. Power supply voltage (single batteries) | V <sub>CC</sub> =1.8V~6V<br>(It is available to operate by two dry cell batteries.) |
| 2. Current consumption                     | 0.1mA typ.                                                                          |
| 3. Power supply line elimination ratio     | 60dB typ.                                                                           |

### Amplifier section

|                                                 |                |
|-------------------------------------------------|----------------|
| 1. Low input offset voltage                     | ±0.1mV typ.    |
| 2. Low input offset voltage drift (-20°C~+75°C) | ±1.0µV/°C typ. |
| 3. Input offset current                         | 1nA typ.       |
| 4. Input bias current                           | 50nA typ.      |
| 5. Gain (Open loop)                             | 100dB typ.     |

### Comparator Section

|                                                 |               |
|-------------------------------------------------|---------------|
| 1. Input offset voltage                         | ±1.0mV typ.   |
| 2. Low input offset voltage drift (-20°C~+75°C) | ±10µV/°C typ. |
| 3. Input bias current                           | ±25nA typ.    |
| 4. Output sink current                          | 5mA min.      |

### Reference Voltage Section

|                                                  |                 |
|--------------------------------------------------|-----------------|
| 1. Reference voltage                             | 1.27V±0.05V     |
| 2. Reference voltage temperature characteristics | ±100ppm/°C typ. |
| 3. Output current                                | 0.3mA min.      |

## Package

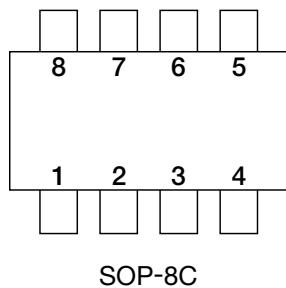

SOP-8C (MM1217XF)  
SIP-9A (MM1217XS)

## Applications

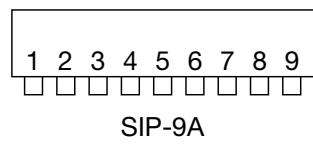

1. Gas burners
2. Instantaneous gas water heaters

## Pin Assignment

MM1217XF

MM1217XS

Note 1 : Amplifier output ... emitter-follower (pull-down resistance  $22\text{k}\Omega$ )

Note 2 : Comparator output ... open collector

## Application Circuits

Flame detection circuit using a thermocouple (single power source)

Note : Use a gain range of 20dB-50dB in the amplifier section (40dB recommended) .

Also, insert the capacitor between output 3 and GND instead of parallel to R2 in order to eliminate noise from the input. Please note that use of the equipment under different conditions will cause vibration.
