## 8-Channel CMOS Logic to High Voltage Level Translator

## FEATURES

2.3 V to 5.5 V input voltage range

Output voltage levels ( $\mathrm{V}_{\text {DDA }}$ and $\mathrm{V}_{\text {DDB }}$ to $\mathrm{V}_{\mathrm{SS}} \leq 35 \mathrm{~V}$ )
Low output voltage levels: down to $\mathbf{- 2 4 . 4} \mathbf{V}$
High output voltage levels: up to +35 V
Rise/fall time: $12 \mathrm{~ns} / 19.5$ ns typical
Propagation delay: 80 ns typical
Operating frequency: 100 kHz typical
Ultralow quiescent current: $65 \mu \mathrm{~A}$ typical
20-lead, Pb-free, TSSOP package

## APPLICATIONS

Low voltage to high voltage translation

## TFT-LCD panels

Piezoelectric motor drivers

## FUNCTIONAL BLOCK DIAGRAM

The ADG3123 is guaranteed to operate over the $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ temperature range and is available in a compact, 20 -lead TSSOP, Pb-free package.

## PRODUCT HIGHLIGHTS

1. Compatible with a wide range of CMOS logic levels.
2. High output voltage levels.
3. Fast rise and fall times coupled with low propagation delay.
4. Ultralow power consumption.
5. Compact, 20-lead TSSOP, Pb-free package.

## ABSOLUTE MAXIMUM RATINGS

$\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$, unless otherwise noted.
Table 2.

| Parameter | Rating |
| :---: | :---: |
| $\mathrm{V}_{\text {DDA }} / V_{\text {DDB }}$ to $\mathrm{V}_{\text {SS }}$ | 44 V |
| VDDB to GND | -0.3 V to +32 V |
| $V_{\text {DDA }}$ to GND | -0.3 V to $\mathrm{V}_{\text {DDB }}$ |
| $V_{\text {ss }}$ to GND | +0.3 V to -32 V |
| Digital Inputs ${ }^{1}$ | $\mathrm{V}_{\text {SS }}-0.3 \mathrm{~V}$ to $\mathrm{V}_{\mathrm{DDB}}+0.3 \mathrm{~V}$ or 20 mA , whichever occurs first |
| Load Current Per Device |  |
| Average | 15 mA at $25^{\circ} \mathrm{C}$ |
|  | 8 mA at $85^{\circ} \mathrm{C}$ |
| Peak Current ${ }^{2}$ | 150 mA at $25^{\circ} \mathrm{C}$ |
|  | 80 mA at $85^{\circ} \mathrm{C}$ |
| Operating Temperature Range <br> Industrial (B Version) $-40^{\circ} \mathrm{C} \text { to }+85^{\circ} \mathrm{C}$ |  |
| Storage Temperature Range | $-65^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$ |
| Junction Temperature | $150^{\circ} \mathrm{C}$ |
| Thermal Impedance, $\theta_{\mathrm{JA}}$ | $78^{\circ} \mathrm{C} / \mathrm{W}^{3}$ |
| Reflow Soldering (Pb-Free) |  |
| Peak Temperature | 260 (+0/-5) ${ }^{\circ} \mathrm{C}$ |
| Time at Peak Temperature | 10 seconds to 40 seconds |

${ }^{1}$ Overvoltage at Pin A1 to Pin A8 is clamped by internal diodes. Limit the current to the maximum ratings given.
${ }^{2}$ Pulsed at $100 \mathrm{kHz} ; 10 \%$ duty cycle maximum with the load shown in Figure 2.
${ }^{3}$ Guaranteed when the device is soldered on a 4-layer board.

## ESD CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although this product features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

## PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

Figure 3. Pin Configuration
Table 3. Pin Function Descriptions

| Pin No. | Mnemonic | Description |
| :--- | :--- | :--- |
| 1 | GND | Ground Reference (0 V). |
| 2 to 9 | A1 to A8 | Level Translator CMOS Inputs. |
| 10 | V SS $^{10}$ | Most Negative Power Supply. Use the $V_{S S}$ pin to generate the output low level for Output Y1 to Output Y8. |
| 11 | V $_{\text {DDB }}$ | Positive Power Supply. Use the V VDB pin to generate the output high level for Output Y7 and Output Y8. |
| 12 to 19 | Y8 to Y1 | Level Translator High Voltage Outputs. |
| 20 | V $_{\text {DDA }}$ | Analog Input. Use the $V_{\text {DDA }}$ pin to generate the output high level for Output Y1 to Output Y6 (VDA $\left.\leq V_{\text {DDB }}\right)$. |

## TERMINOLOGY

$\mathbf{V}_{\mathrm{IH}}$
Logic input high voltage at Pin A1 to Pin A8.
$V_{\text {II }}$
Logic input low voltage at Pin A1 to Pin A8.

## $\mathrm{I}_{\mathrm{IL}}$

Leakage current at Pin A1 to Pin A8.
$\mathrm{C}_{\mathrm{I}}$
Capacitance measured at Pin A1 to Pin A8.
Voн
Logic output high voltage at Pin Y1 to Pin Y8.
Vou
Logic output low voltage at Pin Y1 to Pin Y8.

## Ro

Output impedance.

## $t_{\text {tlh }}$

Propagation delay through the part measured between the input signal applied to any one channel and its corresponding output for a low-to-high transition (see Figure 2).

## $\mathbf{t}_{\text {PHL }}$

Propagation delay through the part measured between the input signal applied to any one channel and its corresponding output for a high-to-low transition (see Figure 2).
$t_{\text {R }}$
Rise time of the output signal at Pin Y1 to Pin Y8 (see Figure 2).
$t_{\mathrm{F}}$
Fall time of the output signal at the Pin Y1 to Pin Y8 (see Figure 2).

Fo
Frequency of the signal applied to the A1 to A8 input pins.
$V_{\text {DDA }}$
Input voltage used to generate the high logic levels for Y1 to Y6 outputs.
$V_{\text {DDB }}$
Positive power supply voltage. Also used to generate the high logic levels for Y7 to Y8 outputs.

## Vss

Negative power supply voltage. It is used to generate the low logic level for Y1 to Y8 outputs.

## GND

Ground (0 V) reference.
$\mathrm{I}_{\mathrm{DDA}}$
Supply current at the $V_{\text {DDA }}$ pin.
$\mathrm{I}_{\mathrm{DDB}}$
Supply current at the $V_{\text {DDB }}$ pin.
Iss
Supply current at the $\mathrm{V}_{\text {ss }}$ pin.

## THEORY OF OPERATION

The ADG3123 is an 8-channel, noninverting CMOS to high voltage level translator. Fabricated on an enhanced LC $^{2}$ MOS process, the device is capable of operating at high supply voltages while maintaining ultralow power consumption.

The device requires a dual-supply voltage, $\mathrm{V}_{\mathrm{DDB}}$ and $\mathrm{V}_{\text {Ss }}$, which sets the low logic levels for all outputs and the high logic levels for the Y7 and Y8 outputs. The V VDA pin acts as an analog input. The voltage applied to the V $\mathrm{V}_{\text {DA }}$ pin sets the output high logic level for the Y1 to Y6 outputs.

The device translates the CMOS logic levels applied to the A1 to A8 inputs into high voltage bipolar levels available on the Y side of the device at Pin Y1 to Pin Y8.

To ensure proper operation, $V_{\text {DDB }}$ must always be greater than or equal to $V_{\text {DDA }}$ and the voltage between the Pin $V_{\text {DDB }}$ and Pin $\mathrm{V}_{\text {SS }}$ should not exceed 35 V .

## INPUT DRIVING REQUIREMENTS

The ADG3123 design ensures low input capacitance and leakage current thereby reducing the loading of the circuit that drives the input pins (Pin A1 to Pin A8) to a minimum. Its input threshold levels are compliant with JEDEC standards for drivers operated from supply voltages between 2.3 V and 5.5 V . It is recommended that the inputs of any unused channel be tied to a stable logic level (low or high).

## OUTPUT LOAD REQUIREMENTS

The low output impedance of the ADG3123 allows each channel to drive both resistive and capacitive loads. The maximum load current is limited by the current carrying capability of any given channel. If more channels are used, the maximum load current per channel is reduced accordingly. Note that the sum of the load currents on all channels should never exceed the absolute maximum ratings specifications.
The average load current on each channel, I IChannel, can be determined using the formulas shown in the Capacitive Loads and the Resistive Loads sections.

## Capacitive Loads

$$
I_{C H A N N E L}(A)=F_{O} \times C_{L} \times\left(V_{D D X}+\left|V_{S S}\right|\right)
$$

where:
$F_{O}$ is the frequency of the signal applied to the channel in Hz . $C_{L}$ is the load capacitance in farads.
$V_{s s}$ is the voltage applied to the $V_{s s}$ pin.
$V_{D D X}$ is $V_{D D A}$ for Y 1 to Y 6 outputs, and $V_{D D B}$ for Y 7 to Y 8 outputs.

## Resistive Loads

$$
I_{\text {CHANNEL }}(A)=\frac{D \times V_{D D X}+(1-D) \times\left|V_{S S}\right|}{R_{L}}
$$

where:
$D$ is the duty cycle of the input signal. $D$ is defined as the ratio between the high state duration of the signal and its period. $R_{L}$ is the load resistor in $\Omega$.
$V_{S S}$ is the voltage applied to the $\mathrm{V}_{\text {ss }}$ pin.
$V_{D D X}$ is $\mathrm{V}_{\text {DDA }}$ for Y 1 to Y 6 outputs, and $\mathrm{V}_{\mathrm{DD}}$ for Y 7 to Y 8 outputs.

## POWER SUPPLIES

The ADG3123 operates from a dual-supply voltage. As good design practice for all CMOS devices dictates, power up the ADG3123 first ( $V_{\text {DDB }}$ and $V_{S S}$ ) before applying the signals to its inputs (A1 to $A 8$ and $V_{\text {DDA }}$ ). To ensure correct operation of the ADG3123, the voltage applied to the $V_{\text {DDB }}$ pin must always be greater than or equal to $V_{\text {DDA }}$ and the voltage between the Pin $V_{\text {DDB }}$ and Pin $V_{\text {SS }}$ should not exceed 35 V .

To ensure optimum performance, use decoupling capacitors on all power supply pins. Furthermore, good engineering and layout practice suggests placing these capacitors as close as possible to the package supply pins.

## APPLICATIONS

The high voltage operation coupled with high current driving capability and the wide range of CMOS levels accepted by the ADG3123, make the device ideal for LCD-TFT panel applications. In this type of application, the controllers that generate the timing signals required to control the pixel scanning process inside the panel are usually low voltage CMOS devices.

Most LCD-TFT panels operate at high supply voltages; therefore, the timing signals generated by the controller require level translation to drive the panel. Figure 18 shows a typical application circuit where the ADG3123 translates eight timing signals provided by the timing controller into high voltage logic levels required to drive the panel.
