MC100EP16VB

3.3V / 5V ECL Differential Receiver/Driver with High and Low Gain

ON Semiconductor®

http://onsemi.com

Description

The EP16VB is a world−class differential receiver/driver. The device is functionally equivalent to the EP16 and LVEP16 devices but with both high and low gain outputs. Q_{HG} and $\overline{Q_{HG}}$ outputs have a DC gain several times larger than the DC gain of an EP16. $\overline{Q}$ output is provided for feedback purposes.

The V_{BB} pin, an internally generated voltage supply, is available to this device only. For single-ended input conditions, the unused differential input is connected to V_{BB} as a switching reference voltage. V_{BB} may also rebias AC coupled inputs. When used, decouple V_{BB} and V_{CC} via a 0.01 μF capacitor and limit current sourcing or sinking to 0.5 mA. When not used, V_{BB} should be left open.

Special considerations are required for differential inputs under No Signal conditions to prevent instability.

The 100 Series contains temperature compensation.
