

# FAN1539/FAN1540

## 1A/1.3A, LDO with Low Quiescent Current

### Features

- Very Low Ground Current ( $I_{GND} = 1\text{mA}$ )
- Excellent Line Regulation
- Excellent Load Regulation
- Very Low Transient Overshoot
- Stable with low ESR Output Capacitor ( $ESR = 0\text{m}\Omega$ )
- Thermal Shutdown
- Current Limit
- Output Options: 3.3V and 1.8V

### Applications

- Disk Drive Circuits
- Desktop Computers
- Laptop, Notebook Computers
- General Purpose Three Terminal Regulator

### Description

The FAN1539/FAN1540 series of high current LDOs (1.0A and 1.3A) has been developed for portable applications where low quiescent current is an important requirement. The device features excellent line and load transient response which does not exceed 10% of nominal output value for full operating temperature range even during power ON cycle and short circuit removal. Internally trimmed, temperature compensated bandgap reference guarantees 2.5% accuracy for full range of input voltage, output current and temperature. Included on the chip are accurate current limit and thermal shutdown protection. Device stability is achieved with only two external low ESR ceramic capacitors.

The FAN1539/FAN1540 is available in thermally enhanced 3x3mm 6-lead MLP, 5x6mm 8-lead MLP and 3-lead TO-252 packages. The 5x6mm MLP package version features a separate Kelvin sense pin for high precision applications.

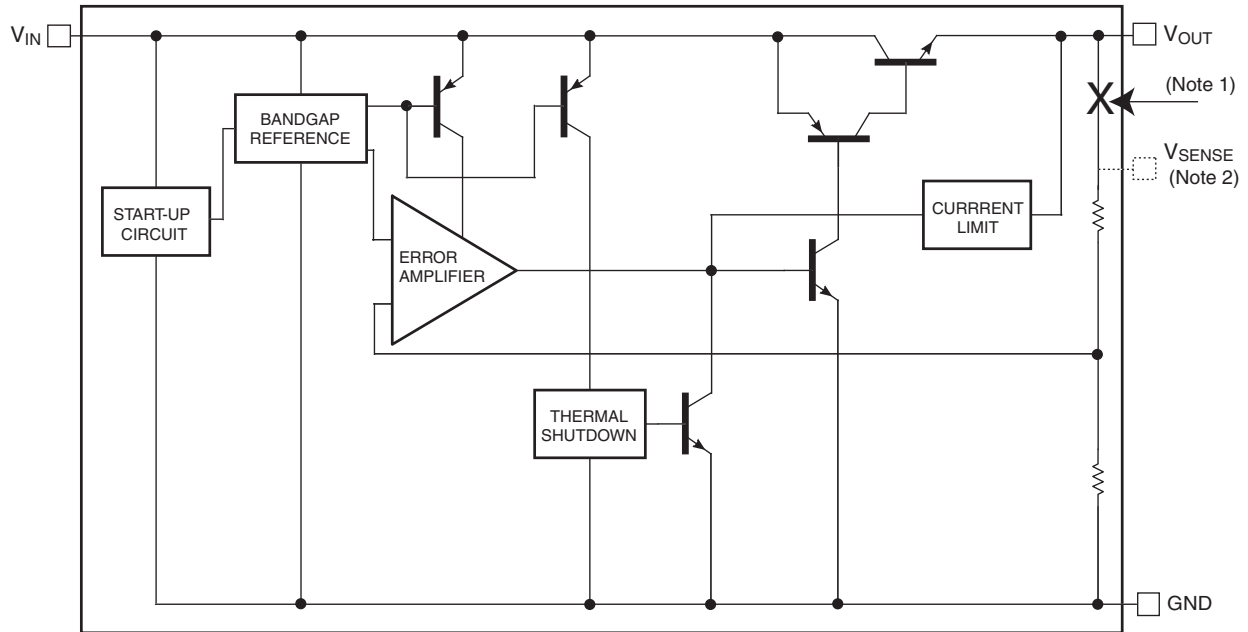

### Ordering Information

Product Number	Output Voltage	Package
FAN1540MMPX	3.3V	5x6mm 8-Lead MLP in T&R
FAN1539MPX	3.3V	3x3mm 6-Lead MLP in T&R
FAN1540MPX	3.3V	3x3mm 6-Lead MLP in T&R
FAN1540DX	3.3V	3-Lead TO-252 in T&R
FAN1540D18X	1.8V	3-Lead TO-252 in T&R

### Tape and Reel Information

Quantity	Reel Size	Width
3000	7"	8mm

## Block Diagram

### Notes:

1. No connection for FAN1540MMPX.
2.  $V_{SEN}$  available for FAN1540MMPX.

## Pin Assignments

## Pin Description

Symbol	Name and Function
$V_{IN}$	Input pin
GND	Ground Pin (Tab)
$V_{OUT}$	Output pin: Fixed Output Voltage
$V_{SEN}$	Output sense pin. Connect to $V_{OUT}$ if Kelvin sensing is not required
NC	No Connection

## Absolute Maximum Ratings

Parameter	Symbol	Value	Units	
Operating Input Voltage	$V_{IN}$	10	V	
Power Dissipation	$P_D$	Internally Limited	W	
Short Circuit Output Current	$I_{OSH}$	Internally Limited	A	
Operating Junction Temperature Range	$T_J$	0 to 150	°C	
Thermal Resistance–Junction to Tab, TO-252	$\theta_{JC}$	3	°C/W	
Thermal Resistance–Junction to Tab, 3mmx3mm 6-lead MLP (Note 3)	$\theta_{JC}$	8	°C/W	
Thermal Resistance–Junction to Tab, 5mmx6mm 8-lead MLP (Note 3)	$\theta_{JC}$	4	°C/W	
Storage Temperature Range (Note 3)	$T_{STG}$	-65 to 150	°C	
Lead Temperature (I.R. Reflow) 30 Sec. (Note 4)	$T_{LEAD}$	240	°C	
Lead Temperature (Soldering) 10 Sec. (Note 4)	$T_{LEAD}$	260	°C	
Electrostatic Discharge Protection (Note 5)	HBM	ESD	4	kV
	CDM		2	

### Notes:

- Junction to ambient thermal resistance,  $\theta_{JA}$ , is a strong function of PCB material, board thickness, thickness and number of copper plains, number of via used, diameter of via used, available copper surface, and attached heat sink characteristics. Thermal resistance ( $\theta_{JA}$ ),  $V_{IN}$ ,  $I_{OUT}$  must be chosen not to exceed  $T_J = 150^\circ\text{C}$ .
- Soldering temperature should be  $260^\circ\text{C}$  for 10 second after  $240^\circ\text{C}$  for 30 second in I.R. reflow using 60/40 solder. Maximum rate of temperature rise is  $3^\circ\text{C}/\text{SEC}$  to within  $100^\circ\text{C}$  of the final temperature.
- Using Mil Std. 883E, method 3015.7(Human Body Model) and EIA/JESD22C101-A (Charge Device Model).

## Electrical Characteristics—FAN1539MPX, FAN1540MPX, FAN1540MMPX, FAN1540DX

Unless otherwise specified,  $V_{IN} = 4.50V$  to  $7V$ ,  $T_j = 25^\circ C$ ,  $I_{MAX}$  (FAN1539) =  $1.0A$ ,  $I_{MAX}$  (FAN1540) =  $1.3A$ .

**Boldface limits** apply over operating junction temperature range of  $0^\circ C \leq T_j \leq 125^\circ C$ .

## Applications Information

### General Circuit Description

The FAN1539/FAN1540 is an advanced low dropout voltage regulator, specially designed for applications in portable computers, where high performance and low quiescent current are required. The device has an internal trimmed bandgap voltage reference and an internal output voltage sense divider. These two signals form the input to the error amplifier which regulates the output voltage.

The FAN1539/FAN1540 has a complete set of internal protection circuitry including thermal shutdown, short circuit current limit and electrostatic discharge protection. Low ESR ceramic capacitors are needed for input as well as output pins to maintain the circuit stability.

### Short Circuit Current Limit

The device has internal over-current limit and short circuit protection. Under over-current conditions the device current is determined by the current limit threshold. Once the device is released from short circuit conditions, the normal level of current limit is gradually re-established as the device output voltage reaches normal levels. Special circuitry has been added to ensure that recovery from short circuit current conditions does not lead to excessive overshoot of the output voltage — a phenomenon often encountered in conventional regulators.

### Thermal Protection

The FAN1539/FAN1540 is designed to supply at least 1A/1.3A output currents. Excessive output load at high input-output voltage difference will cause the device temperature to increase and exceed maximum ratings due to power dissipation. During output overload conditions, when the die temperature exceeds the shutdown limit temperature of 160°C, an onboard thermal protection will disable the output until the temperature drops approximately 15°C below the limit, at which point the output is re-enabled.

### Thermal Characteristics

The FAN1539/FAN1540 is designed to supply at least 1A/1.3A at the specified output voltage with an operating die (junction) temperature of up to 125°C. Once the power dissipation and thermal resistance is known, the maximum junction temperature of the device can be calculated. While the power dissipation is calculated from known electrical parameters, the actual thermal resistance depends on the thermal characteristics of the chosen package and the surrounding PC board copper to which it is mounted.

The power dissipation is equal to the product of the input-to-output voltage differential and the output current plus the ground current multiplied by the input voltage, or:

$$P_D = (V_{IN} - V_{OUT})I_{OUT} + V_{IN}I_{GND}$$

The ground pin current,  $I_{GND}$  can be found in the charts provided in the “Electrical Characteristics” section.

The relationship describing the thermal behavior of the package is:

$$P_{D(max)} = \left\{ \frac{T_{J(max)} - T_A}{\theta_{JA}} \right\}$$

where  $T_{J(max)}$  is the maximum allowable junction temperature of the die, which is 150°C, and  $T_A$  is the ambient operating temperature.  $\theta_{JA}$  is dependent on the surrounding PC board layout and can be empirically obtained. While the  $\theta_{JC}$  (junction-to-case) of the 6-lead MLP package is specified at 8°C/W, the  $\theta_{JA}$  for a minimum PWB footprint will be in substantially higher. This can be improved upon by providing a heat sink of surrounding copper ground on the PWB. Depending on the size of the copper area, and the thickness of the copper layer, the resulting  $\theta_{JA}$  can vary over a wide range. The addition of backside copper with through-holes, stiffeners, and other enhancements can also aid in reducing thermal resistance. ***Thermal simulations performed on a thermally optimized board layout indicate that  $\theta_{JA}$  as low as 20°C/W can be achieved.*** For example, the heat contributed by the dissipation of other devices located nearby must be included in the design considerations.

Overload conditions also need to be considered. It is possible for the device to enter a thermal cycling loop, in which the circuit enters a shutdown condition, cools, re-enables, and then again overheats and shuts down repeatedly due to a persistent fault condition.

### Capacitor ESR and Printed Circuit Board Layout

The FAN1539/FAN1540 has been optimized to accommodate low ESR bypass capacitors down to 0 mΩ. For best results it is important to place *both* input and output bypass capacitors as near to the input and output pins as possible. Use of X7R types such as Murata's GRM31CR70J106KA01B (10μF) and GRM43ER71A226KE01B (22μF) or similar component from TDK. The capacitors should connect directly to the ground plane. Use of ground plane on the top and the bottom side of the PCB is recommended. As many vias as possible should be used to minimize ground plane resistance.
