

# RUE Selection Guide and Product Data

This section has two parts:

- **A Selection Guide that walks you through the process of selecting the correct RUE device for a circuit.**
- **Product Data that outlines electrical characteristics, physical characteristics, agency recognitions, environmental specifications, component layouts, tape and reel specifications, and ordering information for RUE devices.**

## RUE Selection Guide

Follow these seven steps to select a PolySwitch RUE device for a circuit:

1. Define the operating parameters for the circuit.  
These include:
  - Maximum ambient operating temperature
  - Normal operating current
  - Maximum operating voltage (RUE is 30 V maximum)
  - Maximum interrupt current
2. Select the RUE device that accommodates the circuit's maximum ambient operating temperature and normal operating current.
3. Compare the RUE device's maximum operating voltage and maximum interrupt current with the circuit's to be sure the circuit does not exceed the device ratings.
4. Check the RUE device's time-to-trip to be sure it will protect the circuit.
5. Verify that the circuit's ambient operating temperatures are within the RUE device's operating temperature range.
6. Verify that the RUE device's dimensions fit the application's space considerations.
7. Independently evaluate and test the suitability and performance of the RUE device in the application.

4

## 1. Define the circuit's operating parameters.

Fill in the following information about the circuit:

Maximum ambient operating temperature \_\_\_\_\_

Normal operating current \_\_\_\_\_

Maximum operating voltage (RUE is 30 V max.) \_\_\_\_\_

Maximum interrupt current \_\_\_\_\_

## 2. Select the PolySwitch RUE device that will accommodate the circuit's maximum ambient operating temperature and normal operating current.

Look across the top of the table below to find the temperature that most closely matches the circuit's maximum ambient operating temperature. Look down that column to find the value equal to or greater than the circuit's normal operating current. Now look to the far left of that row to find the part number for the RUE device that will best accommodate the circuit.

The thermal derating curve located on the next page is a normalized representation of the data in the table below.

### $I_{Hold}$ vs. temperature

### 3. Compare maximum operating voltages and maximum interrupt currents.

Look down the first column of the table below to find the part number you selected in Step 1. Look to the right in that row to find the device's maximum operating voltage (V max.) and maximum interrupt current (I max.).

Compare both ratings with the circuit's to be sure the circuit's ratings do not exceed those of the RUE device.

#### Maximum device voltages and currents

Part number	V max. (volts)	I max. (amps)*
RUE090	30	40
RUE110	30	40
RUE135	30	40
RUE160	30	40
RUE185	30	40
RUE250	30	40
RUE300	30	40
RUE400	30	40
RUE500	30	40
RUE600	30	40
RUE700	30	40
RUE800	30	40
RUE900	30	40

\*Device may withstand higher interrupt current at lower voltages. Each application will need to be individually qualified.

## 4. Determine time-to-trip.

Time-to-trip is the amount of time it takes for a device to switch to a high-resistance state once a fault current has been applied across the device.

Identifying the RUE device's time-to-trip is important in order to provide the desired protection capabilities. If the device you choose trips too fast, undesired or nuisance tripping will occur. If the device trips too slowly, the components being protected may be damaged before the device switches to a high-resistance state.

The chart below shows the typical time-to-trip at 20°C for each PolySwitch RUE device. For example, the chart indicates that the typical time-to-trip for RUE110 at 8 A is 1 second.

On the chart below, find the typical time-to-trip for the RUE device you selected. If the RUE device's time-to-trip is too fast or too slow for the circuit, go back to Step 2 and choose an alternate device.

## 5. Verify ambient operating conditions.

Ensure that your application's minimum and maximum ambient temperatures are within the operating temperature range of  $-40^{\circ}\text{C}$  and  $85^{\circ}\text{C}$ .

Maximum device surface temperature in the tripped state is  $125^{\circ}\text{C}$ .

## 6. Verify the RUE device's dimensions.

Using dimensions from the table below, compare the dimensions of the RUE device you selected with the application's space considerations.

I<sub>H</sub> = Hold current—maximum current at which the device will not trip at 20°C.

I<sub>T</sub> = Trip current—minimum current at which the device will always trip at 20°C.

P<sub>d</sub> = Typical power dissipation—typical amount of power dissipated by the device when in tripped state in 20°C still air.

R min. = Minimum device resistance at 20°C prior to tripping.

R max. = Maximum device resistance at 20°C prior to tripping.

R<sub>1</sub> max. = Maximum device resistance at 20°C measured 1 hour post trip.

\* Device tested at 40 A.

### WARNING:

- Operation beyond maximum ratings or improper use may result in device damage and possible electrical arcing and flame.
- These devices are intended for protection against occasional over-current or overtemperature fault conditions, and should not be used when repeated fault conditions are anticipated.
- Operation in circuits with inductive spikes can generate voltages above the rated voltage of the devices and should be evaluated for suitability of use.
