MC74LVX245

Octal Bus Transceiver

With 5 V−Tolerant Inputs

The MC74LVX245 is an advanced high speed CMOS octal bus transceiver.

It is intended for two−way asynchronous communication between data buses. The direction of data transmission is determined by the level of the T/$\overline{R}$ input. The output enable pin ($\overline{OE}$) can be used to disable the device, so that the buses are effectively isolated.

All inputs are equipped with protection circuits against static discharge.

Features

- High Speed: t_{PD} = 4.7 ns (Typ) at V_{CC} = 3.3 V
- Low Power Dissipation: I_{CC} = 4 μA (Max) at T_A = 25°C
- Power Down Protection Provided on Inputs
- Balanced Propagation Delays
- Low Noise: V_{OLP} = 0.8 V (Max)
- Pin and Function Compatible with Other Standard Logic Families
- Latchup Performance Exceeds 300 mA
- ESD Performance: Human Body Model > 2000 V;
  Machine Model > 200 V
- Pb−Free Packages are Available*

Application Notes

- Do not force a signal on an I/O pin when it is an active output, damage may occur
- All floating (high impedance) input or I/O pins must be fixed by means of pullup or pulldown resistors or bus terminator ICs
- A parasitic diode is formed between the bus and V_{CC} terminals. Therefore, the LVX245 cannot be used to interface 5.0 V to 3.0 V systems directly

1. Skew is defined as the absolute value of the difference between the actual propagation delay for any two separate outputs of the same device. The specification applies to any outputs switching in the same direction, either HIGH−to−LOW (t_{OSHL}) or LOW−to−HIGH (t_{OSLH}); parameter guaranteed by design.

2. C_{PD} is defined as the value of the internal equivalent capacitance which is calculated from the operating current consumption without load. Average operating current can be obtained by the equation: $I_{CC(OPR)} = C_{PD} \bullet V_{CC} \bullet f_{in} + I_{CC}/8$ (per bit). C_{PD} is used to determine the no−load dynamic power consumption; $P_D = C_{PD} \bullet V_{CC}^2 \bullet f_{in} + I_{CC} \bullet V_{CC}$.
