

FEATURES

- 22 differential HSTL (low-voltage swing) output pairs
- HSTL outputs drive 50Ω to ground with no offset voltage
- 3.3V core supply, 1.8V output supply for reduced power
- LVPECL and HSTL inputs
- Low part-to-part skew (200ps max.)
- Low pin-to-pin skew (50ps max.)
- Triple-buffered output enable (OE)
- -40°C to +85°C temperature range
- Available in a 64-pin EPAD-TQFP

APPLICATIONS

- High-performance PCs
- Workstations
- Parallel processor-based systems
- Other high-performance computing
- Communications

DESCRIPTION

The SY89823L is a high-performance bus clock driver with 22 differential High-Speed Transceiver Logic (HSTL), 1.5V compatible output pairs. The device is designed for use in low-voltage (3.3V/1.8V) applications that require a large number of outputs to drive precisely aligned, ultra-low skew signals to their destination. The input is multiplexed from either HSTL or Low-Voltage Positive-Emitter-Coupled Logic (LVPECL) by the CLK_SEL pin.

The Output Enable (OE) is synchronous and triple-buffered so that the outputs will only be enabled/disabled when they are already in the LOW state. This avoids any potential of generating a runt clock pulse when the device is enabled/disabled, as can occur with an asynchronous control. The triple-buffering feature provides a three-clock delay from the time the OE input is asserted/de-asserted to when the clock appears at the outputs.

The SY89823L features low pin-to-pin skew (50ps max.) and low part-to-part skew (200ps max.), performance previously unachievable in a standard product having such a high number of outputs. The SY89823L is available in a single, space-saving package, enabling a lower overall cost solution.

PIN DESCRIPTION

Pin Number	Pin Name	Type	Pin Function
5, 6	HSTL_CLK, /HSTL_CLK	HSTL Input	Differential clock input selected by CLK_SEL. Can be left floating if not selected. Floating input, if selected, produces an indeterminate output. HSTL input signal requires external termination 50Ω to GND.
8, 9	LVPECL_CLK, /LVPECL_CLK	LVPECL Input	Differential clock input selected by CLK_SEL. Can be left floating. Floating input, if selected, produces a LOW at the output. Requires external termination. 75kΩ pull-up.
7	CLK_SEL	LVTTTL Input	Selects HSTL_CLK input when LOW and LVPECL_CLK output when HIGH. 11kΩ pull-up. Default condition selects LVPECL_CLK if left open.
11	OE	LVTTTL Input	Enable input synchronized internally to prevent glitching of the Q0-Q21 and /Q0-/Q21 outputs. Must be a minimum of three clock periods wide if synchronous with the CLK inputs and must meet the t _S and t _H requirements (refer to "AC Electrical Characteristics" section). If asynchronous, must be a minimum of four clock periods wide. 11kΩ pull-up.
63, 61, 59, 57, 55, 53, 51, 47, 45, 43, 41, 39, 37, 35, 31, 29, 27, 25, 23, 21, 19, 15	Q0-Q21	HSTL Output	Differential clock outputs from HSTL_CLK when CLK_SEL = LOW and LVPECL outputs when CLK_SEL = HIGH. HSTL outputs must be terminated with 50Ω to GND. Q0-Q21 outputs are static LOW when OE = LOW. Unused output pairs may be left floating.
62, 60, 58, 56, 54, 52, 50, 46, 44, 42, 40, 38, 36, 34, 30, 28, 26, 24, 22, 20, 18, 14	/Q0-/Q21	HSTL Output	Differential clock outputs from HSTL_CLK when CLK_SEL = LOW and LVPECL outputs when CLK_SEL = HIGH. HSTL outputs must be terminated with 50Ω to GND. /Q0-/Q21 outputs are static HIGH when OE = LOW. Unused output pairs may be left floating.
4	VCCI	VCC Core Power	Core V _{CC} connected to 3.3V supply. Bypass with 0.1μF in parallel with 0.01μF low ESR capacitors as close to V _{CCI} pins as possible.
1, 16, 17, 32, 33, 48, 49, 64	VCCO	VCC Output Power	Output Buffer V _{CC} connected to 1.8V supply. Bypass with 0.1μF in parallel with 0.01μF low ESR capacitors as close to V _{CCO} pin as possible. All V _{CCO} pins should be connected together on the PCB.
10	GND, Exposed Pad		Ground pin and exposed pad must be connected to the same ground plane.
2, 3, 12, 13	NC		No Connect.

Notes:

1. Permanent device damage may occur if the ratings in the “Absolute Maximum Ratings” section are exceeded. This is a stress rating only and functional operation is not implied at conditions other than those detailed in the operational sections of this data sheet. Exposure to absolute maximum ratings conditions for extended periods may affect device reliability.
2. The data sheet limits are not guaranteed if the device is operated beyond the operating ratings.
3. Valid for 4-layer board.
4. The circuit is designed to meet the DC specifications shown in the above table after thermal equilibrium has been established.

Notes:

- The circuit is designed to meet the DC specifications shown in the above table after thermal equilibrium has been established.
- High-frequency AC-parameters are guaranteed by design and characterization.
- Differential propagation delay is defined as the delay from the crossing point of the differential input signals to the crossing point of the differential output signals.
- The within-device skew is defined as the worst case difference between any two similar delay paths within a single device operating at the same voltage and temperature.
- The part-to-part skew is defined as the absolute worst case difference between any two delay paths on any two devices operating at the same voltage and temperature.
- The $V_{pp}(\text{min})$ is defined as the minimum input differential voltage which will cause no increase in the propagation delay.
- V_{CMR} is defined as the range within which the V_{IH} level may vary, with the device still meeting the propagation delay specification. The numbers in the table are referenced to V_{CCI} . The V_{IL} level must be such that the peak-to-peak voltage is less than 1.0V and greater than or equal to $V_{pp}(\text{min})$. The lower end of the CMR range varies 1:1 with V_{CCI} . The $V_{CMR}(\text{min})$ will be fixed at $3.3V - |V_{CMR}(\text{min})|$.
- OE set-up time is defined with respect to the rising edge of the clock. OE HIGH to LOW transition ensures outputs remain disabled during the next clock cycle. OE LOW-to-HIGH transition enables normal operation of the next input clock.
- Cycle-to-cycle jitter definition: The variation of periods between adjacent cycles, $T_n - T_{n-1}$ where T is the time between rising edges of the output signal.

TIMING DIAGRAMS

Notes:

1. The OE input signal must be a minimum of 3 clock periods with width.
2. The internal enable is asserted and de-asserted on the falling edge of clock.
3. The internal enable occurs 2.5 clock cycles (plus the set-up time of OE with the rising edge of clock) after the rising edge of the external OE.
4. If OE does not meet the t_s of t_H specifications as in asynchronous applications, OE must be a minimum of 4 clock periods in width.
