## Ultra-High Current Pin Driver

## élantec.

The EL7158 high performance pin driver with three-state is suited to many ATE and level-shifting applications. The 12A peak drive capability makes this part an excellent choice when driving high capacitance loads.

The output pin OUT is connected to input pins $\mathrm{V}_{\mathrm{H}}$ or $\mathrm{V}_{\mathrm{L}}$ respectively, depending on the status of the IN pin. When the OE pin is active low, the output is placed in the three-state mode. The isolation of the output FETs from the power supplies enables $\mathrm{V}_{\mathrm{H}}$ and $\mathrm{V}_{\mathrm{L}}$ to be set independently, enabling level-shifting to be implemented. Related to the EL7155, the EL7158 adds a lower supply pin $V_{S^{-}}$and makes $\mathrm{V}_{\mathrm{L}}$ an isolated and independent input. This feature adds applications flexibility and improves switching response due to the increased enhancement of the output FETs.

This pin driver has improved performance over existing pin drivers. It is specifically designed to operate at voltages down to 0 V across the switch elements while maintaining good speed and on-resistance characteristics.

Available in the 8-pin SO package, the EL7158 is specified for operation over the full $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ temperature range.

## Pinout

## Features

- Clocking speeds up to 40 MHz
- $12 n s t_{R} / t_{F}$ at 2000pF CLOAD
- 0.2 ns rise and fall times mismatch
- $0.5 \mathrm{~ns} \mathrm{~T}_{\mathrm{ON}}{ }^{-}$O OFF prop delay mismatch
- 3.5 pF typical input capacitance
- 12A peak drive
- Low on resistance of $0.5 \Omega$
- High capacitive drive capability
- Operates from 4.5 V to 12 V
- Pb-free available

## Applications

- ATE/burn-in testers
- Level shifting
- IGBT drivers
- CCD drivers

## Applications Information

## Product Description

The EL7158 is a high performance 40 MHz pin driver. It contains two analog switches connecting $\mathrm{V}_{\mathrm{H}}$ and $\mathrm{V}_{\mathrm{L}}$ to OUT. Depending on the value of the IN pin, one of the two switches will be closed and the other switch open. An output enable (OE) is also supplied which opens both switches simultaneously.
Due to the topology of the EL7158, both the $V_{H}$ and $V_{L}$ pins can be connected to any voltage between the $\mathrm{V}_{\mathrm{S}^{+}}$and $\mathrm{V}_{\mathrm{S}^{-}}$ pins, but $\mathrm{V}_{\mathrm{H}}$ must be greater than $\mathrm{V}_{\mathrm{L}}$ in order to prevent turning on the body diode at the output stage.

## Three-State Operation

When the OE pin is low, the output is three-state (floating.) The output voltage is the parasitic capacitance's voltage. It can be any voltage between $\mathrm{V}_{\mathrm{H}}$ and $\mathrm{V}_{\mathrm{L}}$, depending on the previous state. At three-state, the output voltage can be pushed to any voltage between $\mathrm{V}_{\mathrm{H}}$ and $\mathrm{V}_{\mathrm{L}}$. The output voltage can't be pushed higher than $\mathrm{V}_{\mathrm{H}}$ or lower than $\mathrm{V}_{\mathrm{L}}$ since the body diode at the output stage will turn on.

## Supply Voltage Range and Input Compatibility

The EL7158 is designed for operation on supplies from 5 V to 18 V ( 4.5 V to 18 V maximum). Table 2 shows the specifications for the relationship between the $\mathrm{V}_{\mathrm{S}^{+}}, \mathrm{V}_{\mathrm{S}^{-}}, \mathrm{V}_{\mathrm{H}}$, $V_{L}$, and GND pins.

All input pins are compatible with both 3 V and 5 V CMOS signals. With a positive supply $\left(\mathrm{V}_{\mathrm{S}^{+}}\right)$of 5 V , the EL7158 is also compatible with TTL inputs.

## Power Supply Bypassing

When using the EL7158, it is very important to use adequate power supply bypassing. The high switching currents developed by the EL7158 necessitate the use of a bypass capacitor between the supplies $\left(\mathrm{V}_{\mathrm{S}^{+}} \& \mathrm{~V}_{\mathrm{S}^{-}}\right)$and GND pins. It is recommended that a $2.2 \mu \mathrm{~F}$ tantalum capacitor be used in parallel with a $0.1 \mu \mathrm{~F}$ low-inductance ceramic MLC capacitor. These should be placed as close to the supply pins as possible. It is also recommended that the $V_{H}$ and $V_{L}$ pins have some level of bypassing, especially if the EL7158 is driving highly capacitive loads.

## Power Dissipation Calculation

When switching at high speeds, or driving heavy loads, the EL7158 drive capability is limited by the rise in die temperature brought about by internal power dissipation. For reliable operation die temperature must be kept below $\mathrm{T}_{\mathrm{JMAX}}\left(125^{\circ} \mathrm{C}\right)$. It is necessary to calculate the power dissipation for a given application prior to selecting the package type.

Power dissipation may be calculated:

$$
P D=\left(V_{S} \times I_{S}\right)+\left(C_{I N T} \times V_{S}^{2} \times f\right)+\left(C_{L} \times V_{O U T}{ }^{2} \times f\right)
$$

where:
$V_{\mathrm{S}}$ is the total power supply to the EL7158 (from $\mathrm{V}_{\mathrm{S}^{+}}$to GND)
$\mathrm{V}_{\text {OUT }}$ is the swing on the output $\left(\mathrm{V}_{\mathrm{H}}-\mathrm{V}_{\mathrm{L}}\right)$
$C_{L}$ is the load capacitance
$\mathrm{C}_{\text {INT }}$ is the internal load capacitance (100pF max)
$I_{S}$ is the quiescent supply current (3mA max)
$f$ is frequency
Having obtained the application's power dissipation, a maximum package thermal coefficient may be determined, to maintain the internal die temperature below $T_{J M A X}$ :
$\theta_{J A}=\frac{T_{J M A X}-T_{\text {MAX }}}{P D}$
where:
$\mathrm{T}_{\mathrm{JMAX}}$ is the maximum junction temperature $\left(125^{\circ} \mathrm{C}\right)$
$\mathrm{T}_{\text {MAX }}$ is the maximum operating temperature
PD is the power dissipation calculated above
$\theta_{\mathrm{JA}}$ thermal resistance on junction to ambient
$\theta_{\mathrm{JA}}$ is $160^{\circ} \mathrm{C} / \mathrm{W}$ for the SO8 package when using a standard JEDEC JESD51-3 single-layer test board. If TJMAX is greater than $125^{\circ} \mathrm{C}$ when calculated using the equation above, then one of the following actions must be taken:

Reduce $\theta_{\mathrm{JA}}$ the system by designing more heat-sinking into the PCB (as compared to the standard JEDEC JESD51-3)

De-rate the application either by reducing the switching frequency, the capacitive load, or the maximum operating (ambient) temperature ( $\mathrm{T}_{\mathrm{MAX}}$ )
