BIPOLAR HALF-BRIDGE MOTOR DRIVERS****FEATURES**

- 3.5 A Peak Output
- 37 V Min. Output Breakdown
- Output Transient Protection
- Tri-State Outputs
- TTL, CMOS, PMOS, NMOS Compatible Inputs
- Internal Thermal Shutdown
- High-Speed Chopper (to 100 kHz)
- UDN-2935Z Replaces SG3635P
- UDN-2950Z Replaces UDN-2949Z, SN75605
- TO-220 Style Packages

BOOTH Type UDN-2935Z and UDN-2950Z integrated circuits are designed for servomotor applications using pulse-width modulation. These two high-current, monolithic half-bridge motor drivers combine a sink-and-source driver with diode transient protection, input gain, level shifting, logic stages, and a voltage regulator for single-supply operation.

The UDN-2935Z output goes high with an active low input at pin 2; it is especially desirable in NMOS microprocessor applications. The UDN-2950Z output goes high with an active high input at pin 2; its inputs can be tied together for single-wire control. The input circuitry of both devices is compatible with TTL and low-voltage CMOS, PMOS, and NMOS logic. Both ICs have logic lockout (tri-state output) that prevents source and sink drivers from turning ON simultaneously.

In typical applications, the chopper-drive mode is characterized by low power-dissipation levels, low saturation voltages, and short chopper-storage times for the sink drivers. The motor drivers can be used in pairs for full-bridge operation, or as triplets in three-phase brushless d-c motor-drive applications. They can also be teamed with the Sprague

Electric 2CN-1202A stepper motor translator/driver for bipolar d-c stepper motor control (see Engineering Bulletin 26184).

The motor drivers' single-chip construction and power-tab TO-220 package enable cost-effective and reliable system designs supported by excellent power-dissipation ratings, minimum size, and ease of installation; because the package's heat tab is at ground potential, several devices can share a common heat sink without insulating hardware.

The Type UDN-2950Z half-bridge motor driver is an improved version of the popular Sprague Type UDN-2949Z, described in Engineering Bulletin 29318. The new driver has a higher output-breakdown rating, logic lockout, and an internal high-temperature shutdown that is triggered at approximately 175°C.

TEST FIGURE 2

APPLICATION NOTES

It should be noted that an additional power dissipation component may arise from crossover currents flowing from supply to ground when current direction through the load is reversed. This is due to differences in the switching speeds between the source and sink drivers. Although the internal logic lockout protects these devices from catastrophic failure, the crossover power component can cause device operation at substantially higher junction temperatures.

If timing conditions are ignored, the magnitude of this power can be approximated as:

$$P_D = V_S \times I_C \times t \times f$$

where V_S = supply voltage

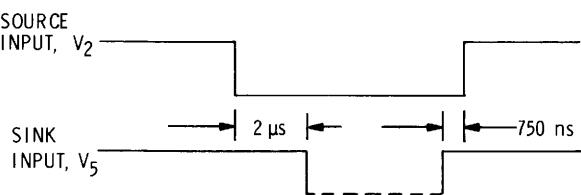

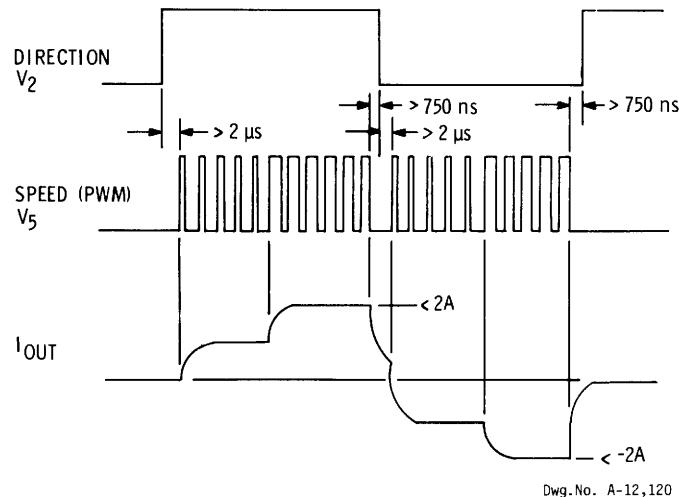

I_C = crossover current (≈ 3.5 A max.)

t = crossover current duration (≈ 1 μ s)

f = frequency of direction change

In some applications (high switching speeds or high package power dissipation), it is recommended that the inputs be driven separately, and that the sink driver not be turned ON for at least 2 μ s (maximum source t_{PD}) after the source driver input is turned OFF. The sink driver should be turned OFF at least 750 ns (maximum sink t_{PD}) before the source driver is turned ON.

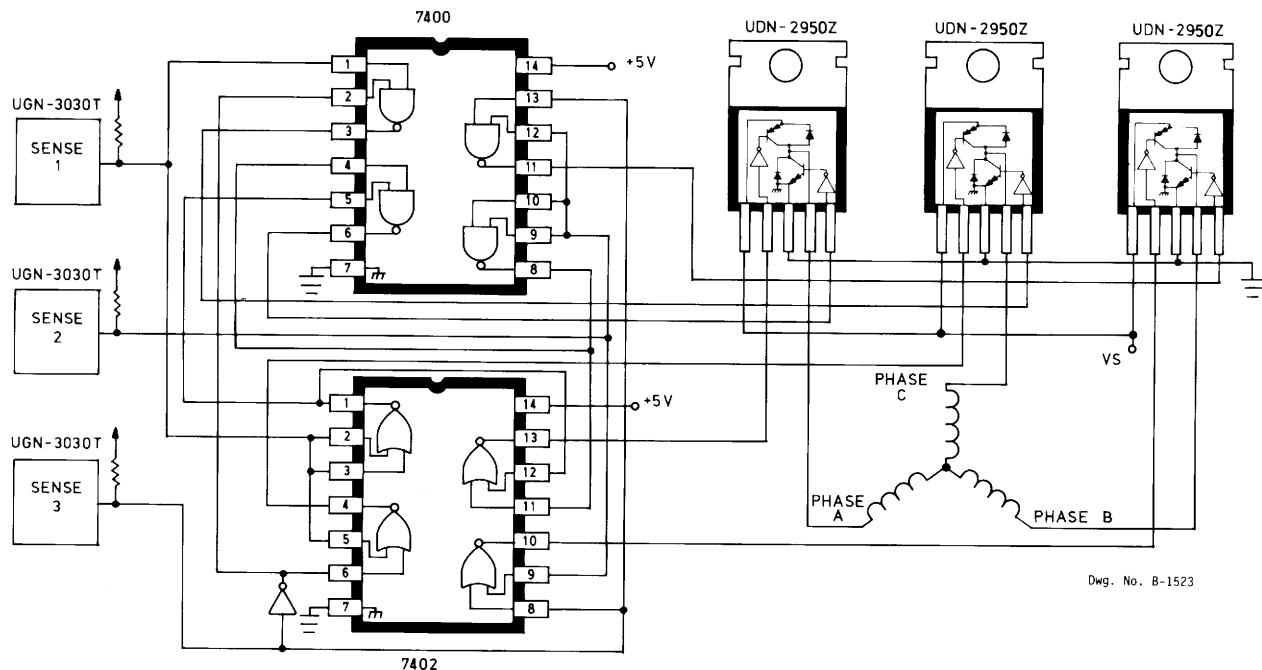

RECOMMENDED TIMING CONDITIONS (UDN-2950Z shown)
