

8-BIT SINGLE-CHIP MICROCONTROLLER

DESCRIPTION

The μ PD780016Y and 780018Y are members of the μ PD780018Y subseries of the 78K/0 series microcontrollers.

Besides a high-speed, high-performance CPU, these microcontrollers have on-chip ROM, RAM, I/O ports, timer, serial interface, real-time output port, interrupt control, and various other peripheral hardware.

The μ PD78P0018Y devices including a one-time PROM version and an EPROM version, both of which can operate in the same power supply voltage range as a mask ROM version, and various development tools are available.

The details of the functions are described in the following user's manuals. Be sure to read it before starting design.

μ PD780018,780018Y Subseries User's Manual: U11754E

78K/0 Series User's Manual – Instructions : IEU-1372

FEATURES

- Internal high capacity ROM and RAM

Part Number	Item	Program Memory (ROM)	Data Memory			Package
			Internal High-Speed RAM	Buffer RAM	Internal Extended RAM	
μ PD780016Y		48K bytes	1024 bytes	32 bytes	1024 bytes	100-pin plastic QFP (14 × 20 mm)
μ PD780018Y		60K bytes				

- External memory expansion space: 64K bytes
- Instruction execution time can be changed from high-speed (0.4 μ s) to ultra-low-speed (122 μ s)
- I/O ports: 88
- 8-bit resolution A/D converter: 8 channels
- Timer: 7 channels
- Serial interface: 3 channels
 - 3-wire serial I/O mode (with automatic data transmit/receive function): 1 channel
 - 3-wire serial I/O mode (with time division transfer function): 1 channel
 - I²C bus mode (supporting multi-task): 1 channel
- Supply voltage : $V_{DD} = 2.7$ to 5.5 V

APPLICATION FIELD

Cellular phones, cordless phones, AV equipment, etc.

The information contained in this document is being issued in advance of the production cycle for the device. The parameters for the device may change before final production or NEC Corporation, at its own discretion, may withdraw the device prior to its production.

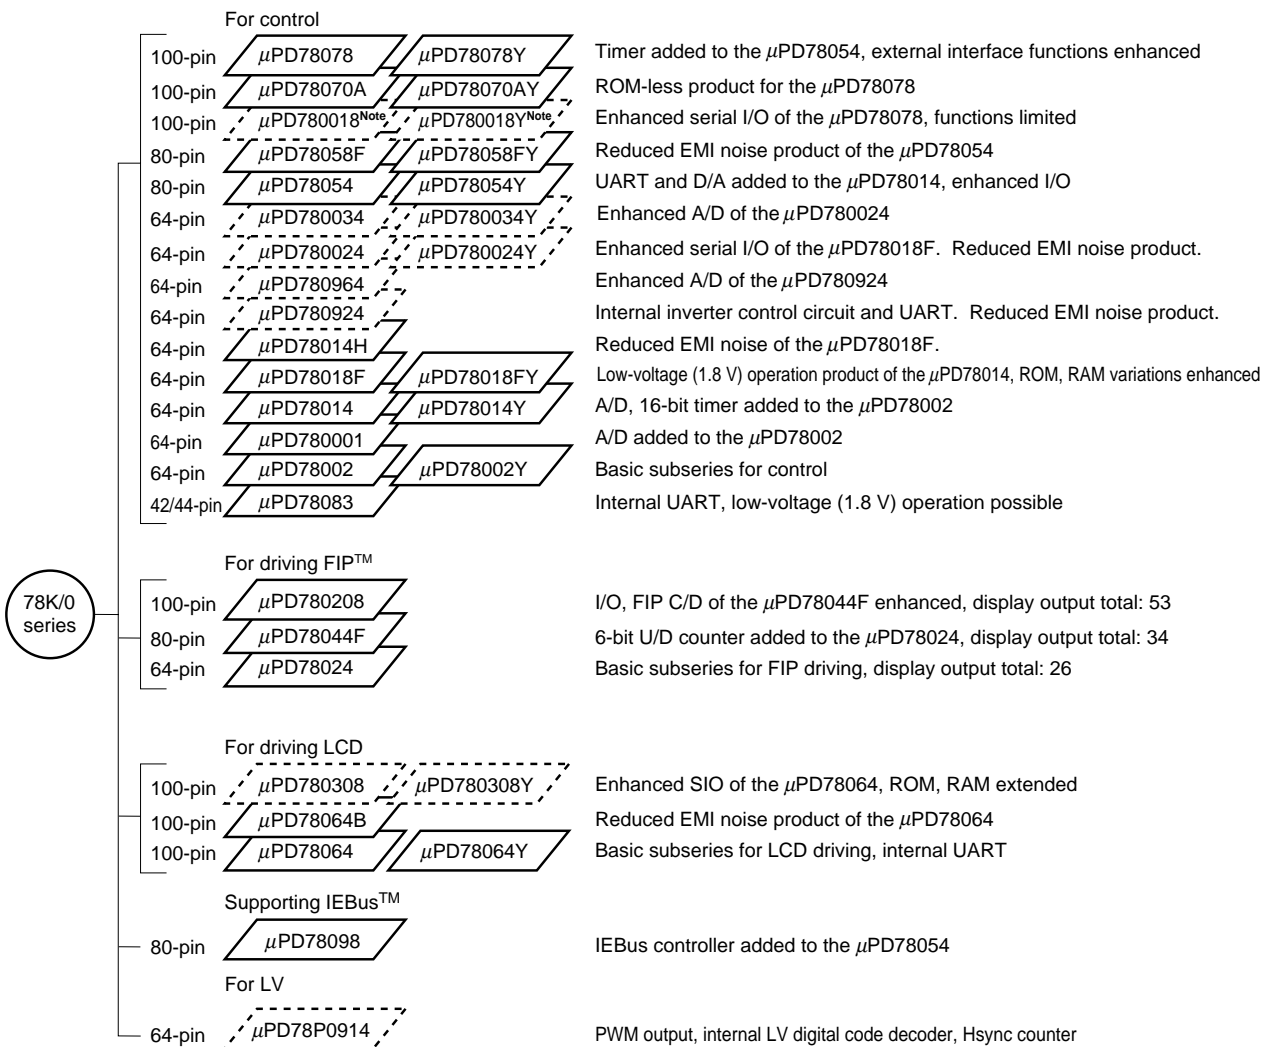

ORDERING INFORMATION

Part Number	Package
μPD780016YGF-XXX-3BA	100-pin plastic QFP (14 × 20 mm)
μPD780018YGF-XXX-3BA	100-pin plastic QFP (14 × 20 mm)

Remark XXX indicates ROM code suffix.

78K/0 SERIES DEVELOPMENT

These products are a further development in the 78K/0 Series. The designations appearing inside the boxes are subseries names.

Note Under planning

The major functional differences among the subseries are shown below.

- 100-pin plastic QFP (14 × 20 mm)
μPD780016YGF-XXX-3BA, 780018YGF-XXX-3BA

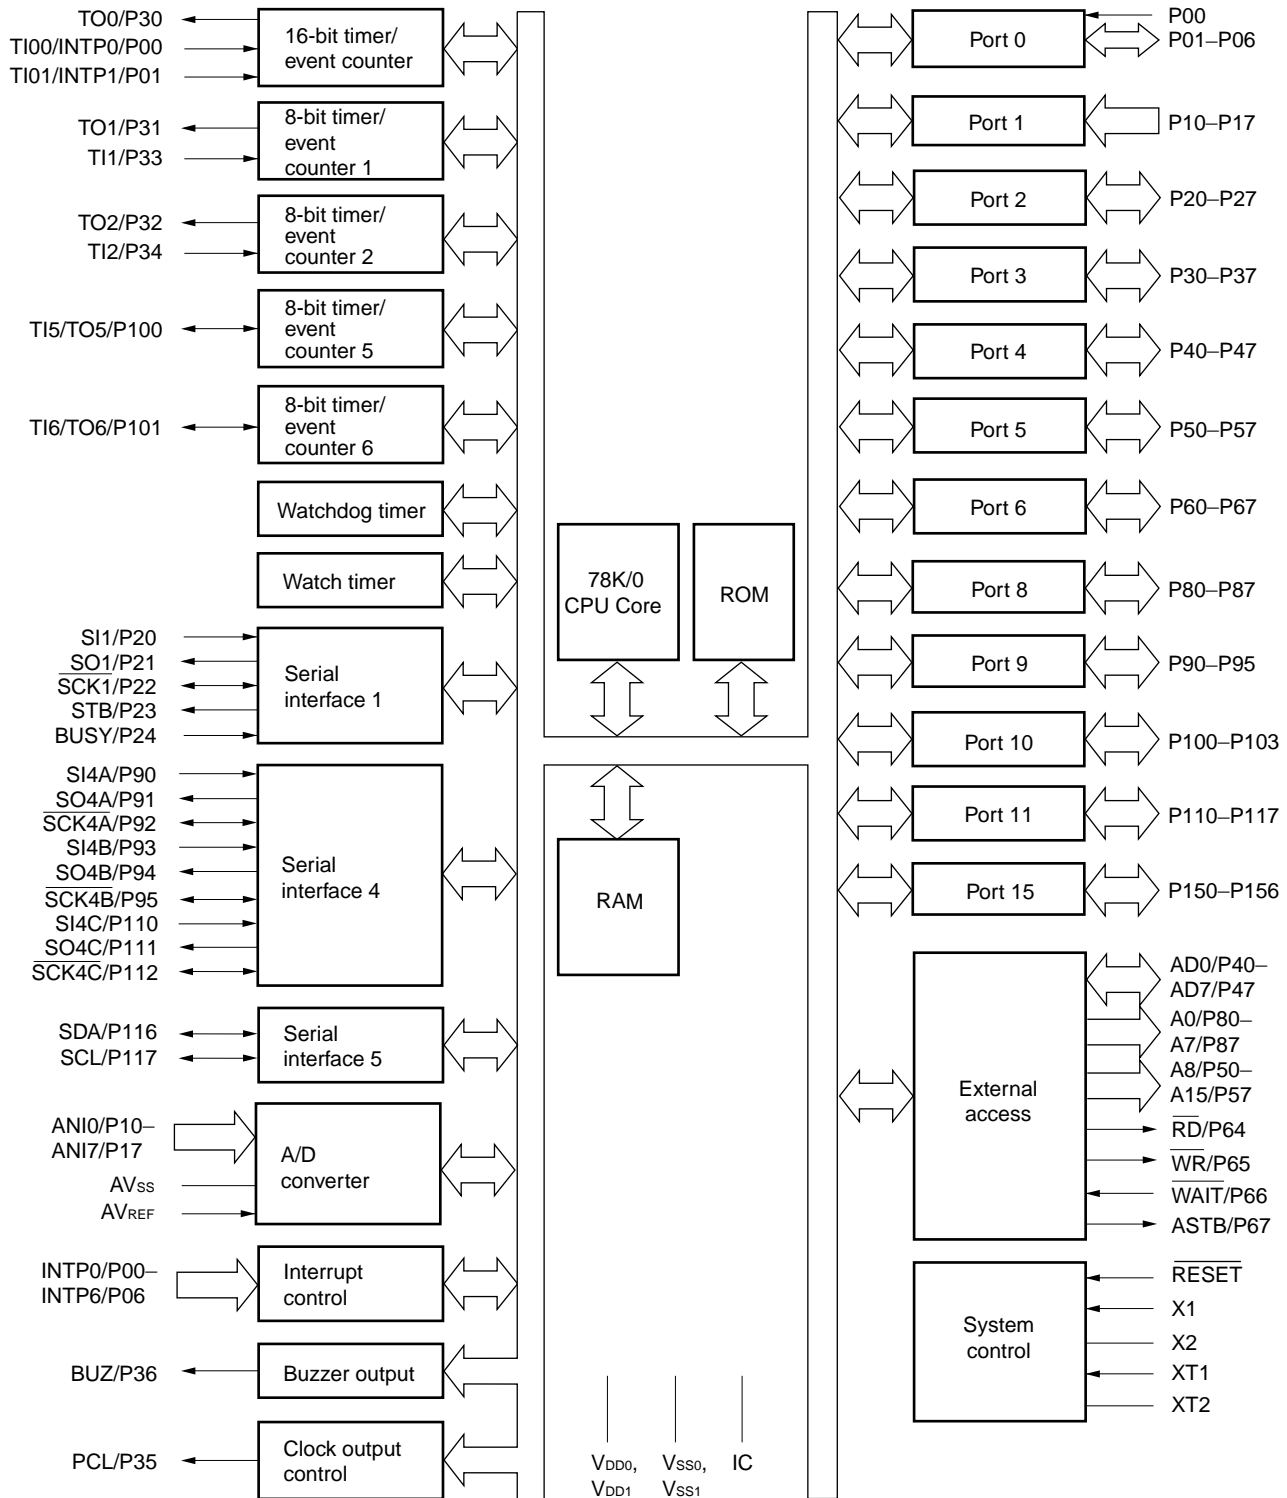

- Cautions 1. Connect IC (internally connected) pin directly to V_{SS0}.**
2. AV_{SS} pin should be connected to V_{SS0}.

Remark When the circuit is used in an application where the noise generated from the inside of the microcontroller needs to be reduced, take countermeasures against noise such as supplying power to V_{DD0} and V_{DD1} separately and connecting V_{SS0} and V_{SS1} to the ground line separately.

4. MEMORY SPACE

The memory map of the μPD780016Y and 780018Y is shown in Figure 4-1.

Figure 4-1. Memory Map

- Notes**
1. If external device expansion functions are to be employed for the μPD780018Y, set the size of the internal ROM to below 56K bytes using the memory size switching register (IMS).
 2. The internal ROM capacity depends on the product. (See the following table.)

Part Number	Internal ROM Last Address nnnnH
μPD780016Y	BFFFH
μPD780018Y	EFFFH

5. PERIPHERAL HARDWARE FUNCTIONS

5.1 Ports

Input/output ports are classified into two types.

- CMOS input (P00, Port 1) : 9
 - CMOS input/output (P01 to P06, Port 2 to 6, Port 8 to 11, Port 15) : 79
-
- Total : 88

Table 5-1. Functions of Ports

Port Name	Pin Name	Function
Port 0	P00	Input only.
	P01 to P06	Input/output port. Input/output can be specified bit-wise. When used as an input port, on-chip pull-up resistor can be used by software.
Port 1	P10 to P17	Input only. On-chip pull-up resistor can be used by software.
Port 2	P20 to P27	Input/output port. Input/output can be specified bit-wise. When used as an input port, on-chip pull-up resistor can be used by software.
Port 3	P30 to P37	Input/output port. Input/output can be specified bit-wise. When used as an input port, on-chip pull-up resistor can be used by software.
Port 4	P40 to P47	Input/output port. Input/output can be specified in 8-bit units. When used as an input port, on-chip pull-up resistor can be used by software. The test input flag (KRIF) is set to 1 by falling edge detection.
Port 5	P50 to P57	Input/output port. Input/output can be specified bit-wise. When used as an input port, on-chip pull-up resistor can be used by software. LED can be driven directly.
Port 6	P60 to P67	Input/output port. Input/output can be specified bit-wise. When used as an input port, on-chip pull-up resistor can be used by software.
Port 8	P80 to P87	Input/output port. Input/output can be specified bit-wise. When used as an input port, on-chip pull-up resistor can be used by software.
Port 9	P90 to P95	Input/output port. Input/output can be specified bit-wise. When used as an input port, on-chip pull-up resistor can be used by software.
Port 10	P100 to P103	Input/output port. Input/output can be specified bit-wise. When used as an input port, on-chip pull-up resistor can be used by software.
Port 11	P110 to P117	Input/output port. Input/output can be specified bit-wise. When used as an input port, on-chip pull-up resistor can be used by software.
Port 15	P150 to P156	Input/output port. Input/output can be specified bit-wise. When used as an input port, on-chip pull-up resistor can be used by software.

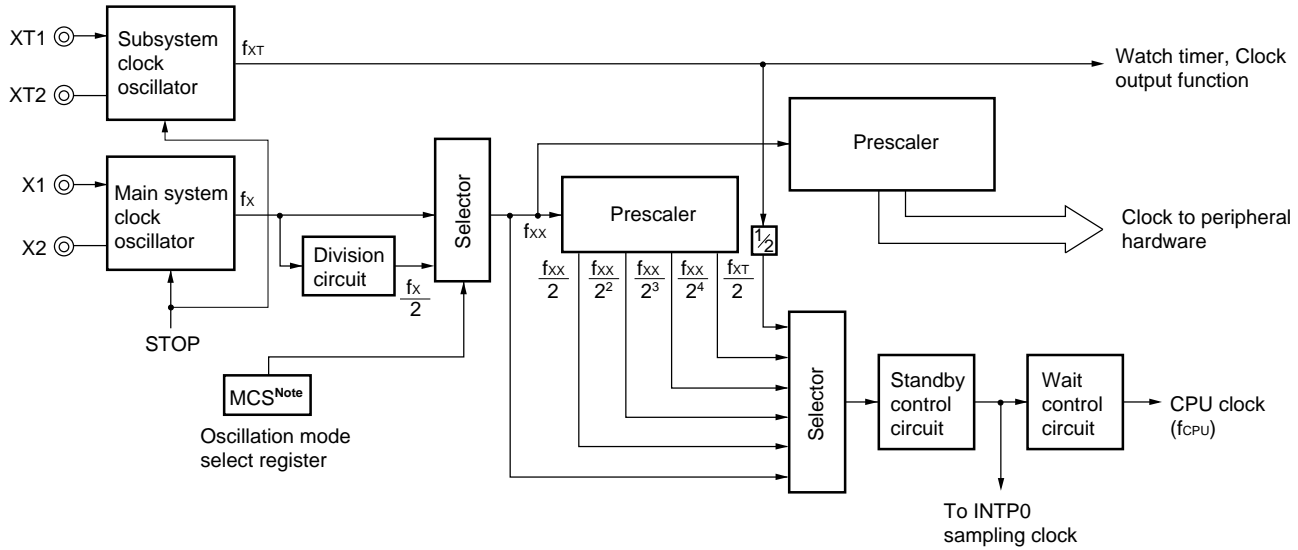

5.2 Clock Generator

There are two kinds of clock generators: main system and subsystem clock generators.

It is possible to change the instruction execution time.

- 0.4 μs/0.8 μs/1.6 μs/3.2 μs/6.4 μs (at main system clock frequency of 5.0 MHz)
- 122 μs (at subsystem clock frequency of 32.768 kHz)

Figure 5-1. Clock Generator Block Diagram

Note Be sure to set 1 to MCS.

5.3 Timer/Event Counter

There are the following seven timer/event counter channels:

- 16-bit timer/event counter : 1 channel
- 8-bit timer/event counter : 4 channels
- Watch timer : 1 channel
- Watchdog timer : 1 channel

Table 5-2. Types and Functions of Timer/Event Counters

5.4 Clock Output Control Circuit

This circuit can output clocks of the following frequencies:

- 39.1 kHz/78.1 kHz/156 kHz/313 kHz/625 kHz/1.25 MHz/2.5 MHz/5.0 MHz (at main system clock frequency of 5.0 MHz)
- 32.768 kHz (at subsystem clock frequency of 32.768 kHz)

5.6 A/D Converter

The A/D converter consists of eight 8-bit resolution channels.

A/D conversion can be started by the following two methods:

- Hardware starting
- Software starting

Figure 5-9. A/D Converter Block Diagram

5.7 Serial Interfaces

There are the following three on-chip serial interface channels synchronous with the clock:

- Serial interface channel 1
- Serial interface channel 4
- Serial interface channel 5

Table 5-3. Types and Functions of Serial Interfaces

6. INTERRUPT FUNCTIONS AND TEST FUNCTIONS

6.1 Interrupt Functions

A total of 21 interrupt functions are provided, divided into the following three types.

- Non-maskable : 1
- Maskable : 19
- Software : 1

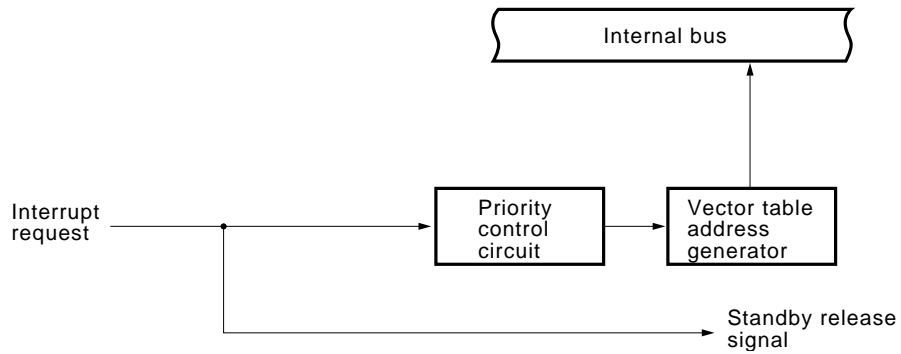

Table 6-1. List of Interrupt Factors

Interrupt Type	Default ^{Note 1} Priority	Interrupt Factor		Internal/External	Vector Table Address	Basic ^{Note 2} Structure Type		
		Name	Trigger					
Non-maskable	—	INTWDT	Overflow of watchdog timer (When the watchdog timer mode 1 is selected)	Internal	0004H	(A)		
Maskable	0	INTWDT	Overflow of watchdog timer (When the interval timer mode is selected)			External	0006H 0008H 000AH 000CH 000EH 0010H 0012H	(B)
	1	INTP0	Pin input edge detection	Internal	0016H 001EH 0020H 0022H 0024H 0026H 0028H 002AH 002CH 002EH 0030H			(B)

	3	INTP2						
	4	INTP3						
	5	INTP4						
	6	INTP5						
	7	INTP6						
	8	INTCSI1						
	9	INTTM3	Reference interval signal from watch timer					
	10	INTTM00	Generation of matching signal of 16-bit timer register and capture/compare register (CR00)					
	11	INTTM01	Generation of matching signal of 16-bit timer register and capture/compare register (CR01)					
	12	INTTM1	Generation of matching signal of 8-bit timer/event counter 1					
	13	INTTM2	Generation of matching signal of 8-bit timer/event counter 2					
	14	INTAD	Completion of A/D conversion					
	15	INTTM5	Generation of matching signal of 8-bit timer/event counter 5					
	16	INTTM6	Generation of matching signal of 8-bit timer/event counter 6					
	17	INTCSI4	Completion of serial interface channel 4 transfer					
	18	INTIIC	Completion of serial interface channel 5 transfer					
Software	—	BRK	Execution of BRK instruction	—	003EH	(E)		

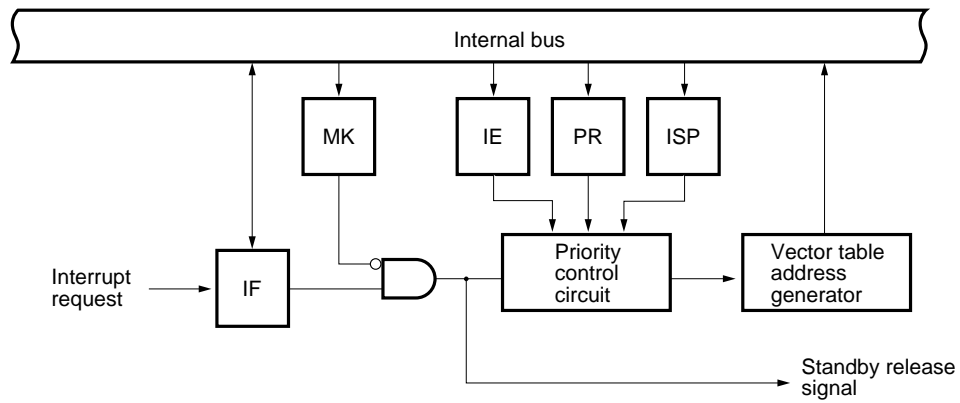

- Notes**
1. Default priority is the priority order when several maskable interruptions are generated at the same time. 0 is the highest order and 18 is the lowest order.
 2. Basic structure types (A) to (E) correspond to (A) to (E) in Figure 6-1.

 MK : Test mask flag

7. EXTERNAL DEVICE EXPANSION FUNCTIONS

The external device expansion functions connect external devices to areas other than the internal ROM, RAM and SFR.

External devices connection uses ports 4 to 6 and port 8.

The external device expansion function has the following two modes:

- Separate bus mode : External devices are connected by using an independent address bus and data bus. Because an external latch circuit is not necessary, this mode is effective for reducing the number of components and the mounting area on a printed wiring board.
- Multiplexed bus mode : External devices are connected by using a time-division multiplexed address/data bus. This mode is useful for reducing the number of ports used when external devices are connected.

8. STANDBY FUNCTION

The standby function intends to reduce current consumption. It has the following three modes:

- HALT mode : In this mode, the CPU operation clock is stopped. The average current consumption can be reduced by intermittent operation by combining this mode with the normal operation mode.
- Main STOP mode : In this mode, oscillation of the main system clock is stopped. The power consumption can be reduced because the whole internal circuit is stopped.
- Sub-STOP mode : In this mode, oscillation of the subsystem clock is stopped. The whole operation is stopped and the power is consumed very little.

Figure 8-1. Standby Function

Note Current consumption is reduced by shutting off the main system clock.

If the CPU is operating on subsystem clock, shut off the main system clock by setting MCC. You cannot use a STOP instruction in HALT mode.

- Cautions**
1. The main stop mode can be used only when the main system clock is being operated. (The oscillation of the subsystem clock cannot be stopped.)
 2. When switching on the main system clock again after the subsystem clock has been used with the main system clock stopped, be sure to provide enough time for the generation to be stable with the program first.

9. RESET FUNCTION

There are the following two reset methods.

- External reset input by $\overline{\text{RESET}}$ pin
- Internal reset by watchdog timer inadvertent program loop time detection

10. INSTRUCTION SET

(1) 8-bit instructions

NOTES FOR CMOS DEVICES

① PRECAUTION AGAINST ESD FOR SEMICONDUCTORS

Note: Strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it once, when it has occurred. Environmental control must be adequate. When it is dry, humidifier should be used. It is recommended to avoid using insulators that easily build static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work bench and floor should be grounded. The operator should be grounded using wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with semiconductor devices on it.

② HANDLING OF UNUSED INPUT PINS FOR CMOS

Note: No connection for CMOS device inputs can be cause of malfunction. If no connection is provided to the input pins, it is possible that an internal input level may be generated due to noise, etc., hence causing malfunction. CMOS device behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using a pull-up or pull-down circuitry. Each unused pin should be connected to V_{DD} or GND with a resistor, if it is considered to have a possibility of being an output pin. All handling related to the unused pins must be judged device by device and related specifications governing the devices.

③ STATUS BEFORE INITIALIZATION OF MOS DEVICES

Note: Power-on does not necessarily define initial status of MOS device. Production process of MOS does not define the initial operation status of the device. Immediately after the power source is turned ON, the devices with reset function have not yet been initialized. Hence, power-on does not guarantee out-pin levels, I/O settings or contents of registers. Device is not initialized until the reset signal is received. Reset operation must be executed immediately after power-on for devices having reset function.

Regional Information

Some information contained in this document may vary from country to country. Before using any NEC product in your application, please contact the NEC office in your country to obtain a list of authorized representatives and distributors. They will verify:

- Device availability
- Ordering information
- Product release schedule
- Availability of related technical literature
- Development environment specifications (for example, specifications for third-party tools and components, host computers, power plugs, AC supply voltages, and so forth)
- Network requirements

In addition, trademarks, registered trademarks, export restrictions, and other legal issues may also vary from country to country.

NEC Corporation does not assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from use of a device described herein or any other liability arising from use of such device. No license, either express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of NEC Corporation or others.

While NEC Corporation has been making continuous effort to enhance the reliability of its semiconductor devices, the possibility of defects cannot be eliminated entirely. To minimize risks of damage or injury to persons or property arising from a defect in an NEC semiconductor device, customers must incorporate sufficient safety measures in its design, such as redundancy, fire-containment, and anti-failure features.

NEC devices are classified into the following three quality grades:

"Standard", "Special", and "Specific". The Specific quality grade applies only to devices developed based on a customer designated "quality assurance program" for a specific application. The recommended applications of a device depend on its quality grade, as indicated below. Customers must check the quality grade of each device before using it in a particular application.

Standard: Computers, office equipment, communications equipment, test and measurement equipment, audio and visual equipment, home electronic appliances, machine tools, personal electronic equipment and industrial robots

Special: Transportation equipment (automobiles, trains, ships, etc.), traffic control systems, anti-disaster systems, anti-crime systems, safety equipment and medical equipment (not specifically designed for life support)

Specific: Aircrafts, aerospace equipment, submersible repeaters, nuclear reactor control systems, life support systems or medical equipment for life support, etc.

The quality grade of NEC devices is "Standard" unless otherwise specified in NEC's Data Sheets or Data Books. If customers intend to use NEC devices for applications other than those specified for Standard quality grade, they should contact an NEC sales representative in advance.

Anti-radioactive design is not implemented in this product.
