CY7C09369V/79V/89V

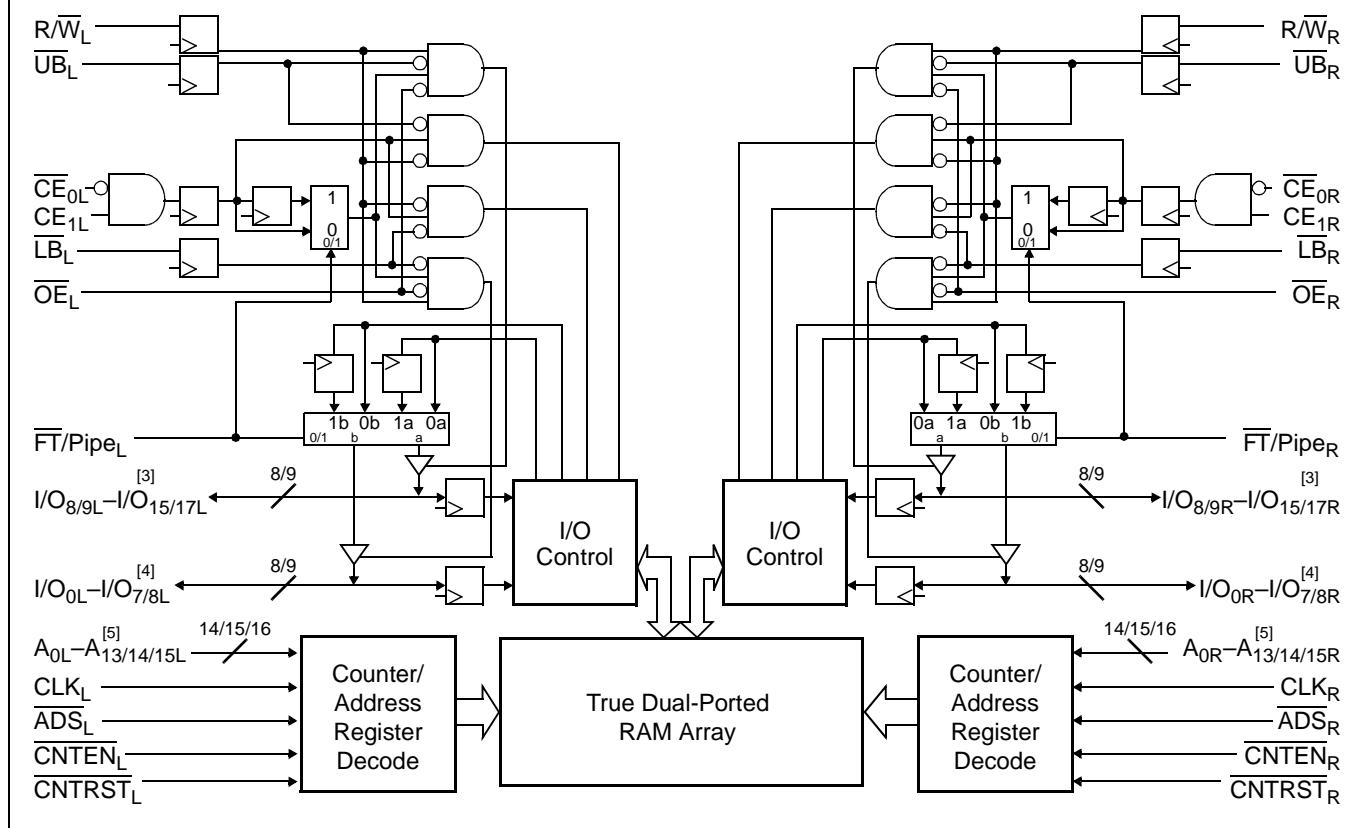

## 3.3V 16K/32K/64K x 16/18 Synchronous Dual-Port Static RAM

### Features

- True Dual-Ported memory cells which allow simultaneous access of the same memory location
- 6 Flow-Through/Pipelined devices
  - 16K x 16/18 organization (CY7C09269V/369V)
  - 32K x 16/18 organization (CY7C09279V/379V)
  - 64K x 16/18 organization (CY7C09289V/389V)
- 3 Modes
  - Flow-Through
  - Pipelined
  - Burst
- Pipelined output mode on both ports allows fast 100-MHz operation
- 0.35-micron CMOS for optimum speed/power

- High-speed clock to data access 6.5<sup>[1, 2]</sup>/7.5<sup>[2]</sup>/9/12 ns (max.)
- 3.3V low operating power
  - Active = 115 mA (typical)
  - Standby = 10  $\mu$ A (typical)
- Fully synchronous interface for easier operation
- Burst counters increment addresses internally
  - Shorten cycle times
  - Minimize bus noise
  - Supported in Flow-Through and Pipelined modes
- Dual Chip Enables for easy depth expansion
- Upper and Lower Byte Controls for Bus Matching
- Automatic power-down
- Commercial and Industrial temperature ranges
- Available in 100-pin TQFP

### Logic Block Diagram

#### Notes:

- Call for availability.
- See page 6 for Load Conditions.
- I/O<sub>8</sub>-I/O<sub>15</sub> for x16 devices; I/O<sub>9</sub>-I/O<sub>17</sub> for x18 devices.
- I/O<sub>0</sub>-I/O<sub>7</sub> for x16 devices. I/O<sub>0</sub>-I/O<sub>8</sub> for x18 devices.
- A<sub>0</sub>-A<sub>13</sub> for 16K; A<sub>0</sub>-A<sub>14</sub> for 32K; A<sub>0</sub>-A<sub>15</sub> for 64K devices.

Document #: 38-06056 Rev. \*\* Revised September 21, 2001

## Functional Description

The CY7C09269V/79V/89V and CY7C09369V/79V/89V are high-speed 3.3V synchronous CMOS 16K, 32K, and 64K x 16/18 dual-port static RAMs. Two ports are provided, permitting independent, simultaneous access for reads and writes to any location in memory.<sup>[6]</sup> Registers on control, address, and data lines allow for minimal set-up and hold times. In pipelined output mode, data is registered for decreased cycle time. Clock to data valid  $t_{CD2} = 6.5 \text{ ns}$ <sup>[1, 2]</sup> (pipelined). Flow-through mode can also be used to bypass the pipelined output register to eliminate access latency. In flow-through mode data will be available  $t_{CD1} = 18 \text{ ns}$  after the address is clocked into the device. Pipelined output or flow-through mode is selected via the FT/Pipe pin.

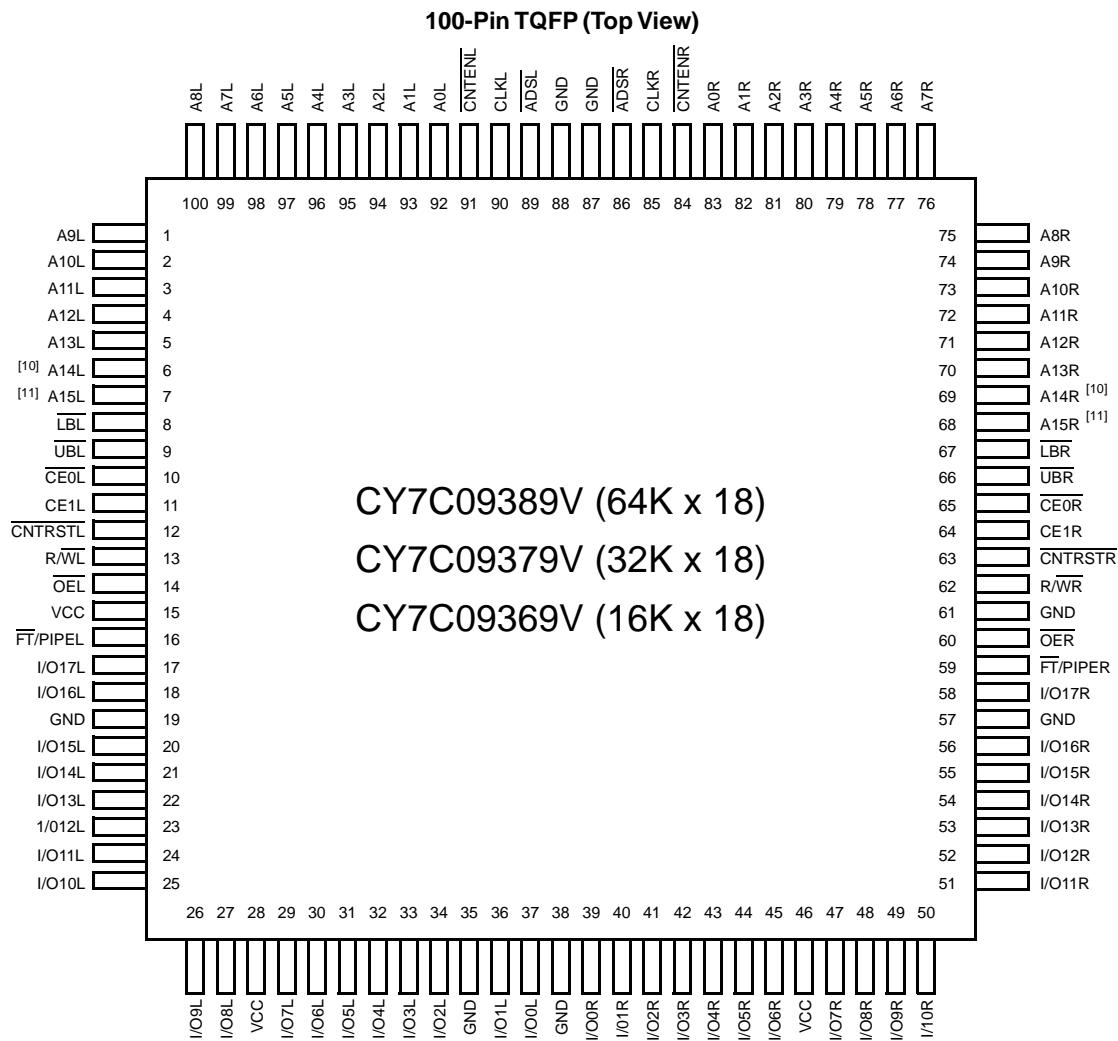

Each port contains a burst counter on the input address register. The internal write pulse width is independent of the LOW to HIGH transition of the clock signal. The internal write pulse is self-timed to allow the shortest possible cycle times.

## Pin Configurations

### Notes:

6. When writing simultaneously to the same location, the final value cannot be guaranteed.
7. This pin is NC for CY7C09269V.
8. This pin is NC for CY7C09269V and CY7C09279V.
9. For CY7C09269V and CY7C09279V, pin #18 connected to V<sub>CC</sub> is pin compatible to an IDT 5V x16 pipelined device; connecting pin #18 and #58 to GND is pin compatible to an IDT 5V x16 flow-through device.

**Pin Configurations (continued)**

**Selection Guide**

f <sub>MAX2</sub> (MHz) (Pipelined)	100	83	67	50
Max. Access Time (ns) (Clock to Data, Pipelined)	6.5	7.5	9	12
Typical Operating Current I <sub>CC</sub> (mA)	175	155	135	115
Typical Standby Current for I <sub>SB1</sub> (mA) (Both Ports TTL Level)	25	25	20	20
Typical Standby Current for I <sub>SB3</sub> (µA) (Both Ports CMOS Level)	10 µA	10 µA	10 µA	10 µA

**Notes:**

10. This pin is NC for CY7C09369V.
11. This pin is NC for CY7C09369V and CY7C09379V.

## Pin Definitions

Left Port	Right Port	Description
A <sub>0L</sub> –A <sub>15L</sub>	A <sub>0R</sub> –A <sub>15R</sub>	Address Inputs (A <sub>0</sub> –A <sub>14</sub> for 32K, A <sub>0</sub> –A <sub>13</sub> for 16K devices).
ADS <sub>L</sub>	ADS <sub>R</sub>	Address Strobe Input. Used as an address qualifier. This signal should be asserted LOW to access the part using an externally supplied address. Asserting this signal LOW also loads the burst counter with the address present on the address pins.
CE <sub>0L</sub> ,CE <sub>1L</sub>	CE <sub>0R</sub> ,CE <sub>1R</sub>	Chip Enable Input. To select either the left or right port, both CE <sub>0</sub> AND CE <sub>1</sub> must be asserted to their active states (CE <sub>0</sub> ≤ V <sub>IL</sub> and CE <sub>1</sub> ≥ V <sub>IH</sub> ).
CLK <sub>L</sub>	CLK <sub>R</sub>	Clock Signal. This input can be free running or strobed. Maximum clock input rate is f <sub>MAX</sub> .
CNTEN <sub>L</sub>	CNTEN <sub>R</sub>	Counter Enable Input. Asserting this signal <u>LOW</u> increments the <u>burst address</u> counter of its respective port on each rising edge of CLK. CNTEN is disabled if ADS or CNTRST are asserted <u>LOW</u> .
CNTRST <sub>L</sub>	CNTRST <sub>R</sub>	Counter Reset Input. Asserting this signal <u>LOW</u> resets the <u>burst address</u> counter of its respective port to zero. CNTRST is not disabled by asserting ADS or CNTEN.
I/O <sub>0L</sub> –I/O <sub>17L</sub>	I/O <sub>0R</sub> –I/O <sub>17R</sub>	Data Bus Input/Output (I/O <sub>0</sub> –I/O <sub>15</sub> for x16 devices).
LB <sub>L</sub>	LB <sub>R</sub>	Lower Byte Select Input. Asserting this signal <u>LOW</u> enables read and write operations to the lower byte. (I/O <sub>0</sub> –I/O <sub>8</sub> for x18, I/O <sub>0</sub> –I/O <sub>7</sub> for x16) of the memory array. For read operations both the LB and OE signals must be asserted to drive output data on the lower byte of the data pins.
UB <sub>L</sub>	UB <sub>R</sub>	Upper Byte Select Input. Same function as LB, but to the upper byte (I/O <sub>8/9L</sub> –I/O <sub>15/17L</sub> ).
OE <sub>L</sub>	OE <sub>R</sub>	Output Enable Input. This signal must be asserted <u>LOW</u> to enable the I/O data pins during read operations.
R/W <sub>L</sub>	R/W <sub>R</sub>	Read/Write Enable Input. This signal is asserted <u>LOW</u> to write to the dual port memory array. For read operations, assert this pin <u>HIGH</u> .
FT/PIPE <sub>L</sub>	FT/PIPE <sub>R</sub>	Flow-Through/Pipelined Select Input. For flow-through mode operation, assert this pin <u>LOW</u> . For pipelined mode operation, assert this pin <u>HIGH</u> .
GND		Ground Input.
NC		No Connect.
V <sub>CC</sub>		Power Input.

## Maximum Ratings

(Above which the useful life may be impaired. For user guidelines, not tested.)

Storage Temperature ..... –65°C to +150°C

Ambient Temperature with

Power Applied..... –55°C to +125°C

Supply Voltage to Ground Potential ..... –0.5V to +4.6V

DC Voltage Applied to  
Outputs in High Z State ..... –0.5V to V<sub>CC</sub>+0.5V

DC Input Voltage..... –0.5V to V<sub>CC</sub>+0.5V

Output Current into Outputs (LOW)..... 20 mA

Static Discharge Voltage ..... >1100V

Latch-Up Current ..... >200mA

## Operating Range

Range	Ambient Temperature	V <sub>CC</sub>
Commercial	0°C to +70°C	3.3V ± 300 mV
Industrial	–40°C to +85°C	3.3V ± 300 mV

**Notes:**

14. Test conditions used are Load 2.  
 15. This parameter is guaranteed by design, but it is not production tested.

## Switching Waveforms

Read Cycle for Flow-Through Output ( $\overline{FT}/PIPE = V_{IL}$ )<sup>[16, 17, 18, 19]</sup>

Read Cycle for Pipelined Operation ( $\overline{FT}/PIPE = V_{IH}$ )<sup>[16, 17, 18, 19]</sup>

**Notes:**

16.  $\overline{OE}$  is asynchronously controlled; all other inputs are synchronous to the rising clock edge.
17.  $ADS = V_{IL}$ ,  $CNTEN$  and  $CNTRST = V_{IH}$ .
18. The output is disabled (high-impedance state) by  $\overline{CE}_0 = V_{IH}$  or  $CE_1 = V_{IL}$  following the next rising edge of the clock.
19. Addresses do not have to be accessed sequentially since  $ADS = V_{IL}$  constantly loads the address on the rising edge of the CLK. Numbers are for reference only.

### Switching Waveforms (continued)

#### Bank Select Pipelined Read<sup>[20, 21]</sup>

#### Left Port Write to Flow-Through Right Port Read<sup>[22, 23, 24, 25]</sup>

#### Notes:

20. In this depth expansion example, B1 represents Bank #1 and B2 is Bank #2; Each Bank consists of one Cypress dual-port device from this datasheet. ADDRESS<sub>(B1)</sub> = ADDRESS<sub>(B2)</sub>.
21. UB, LB, OE and ADS = V<sub>IL</sub>; CE<sub>1(B1)</sub>, R/W, CNTEN, and CNTRST = V<sub>IH</sub>.
22. The same waveforms apply for a right port write to flow-through left port read.
23. CE<sub>0</sub>, UB, LB, and ADS = V<sub>IL</sub>; CE<sub>1</sub>, CNTEN, and CNTRST = V<sub>IH</sub>.
24. OE = V<sub>IL</sub> for the Right Port, which is being read from. OE = V<sub>IH</sub> for the Left Port, which is being written to.
25. If t<sub>CCS</sub> ≤ maximum specified, then data from right port READ is not valid until the maximum specified for t<sub>CWDD</sub>. If t<sub>CCS</sub>>maximum specified, then data is not valid until t<sub>CCS</sub> + t<sub>CD1</sub>. t<sub>CWDD</sub> does not apply in this case.

**Switching Waveforms (continued)**
**Pipelined Read-to-Write-to-Read ( $\overline{OE} = V_{IL}$ )<sup>[19, 26, 27, 28]</sup>**

**Pipelined Read-to-Write-to-Read (OE Controlled)<sup>[19, 26, 27, 28]</sup>**

**Notes:**

26. Output state (High, Low, or high impedance) is determined by the previous cycle control signals.
27.  $\overline{CE}_0$  and  $ADS = V_{IL}$ ;  $CE_1$ ,  $CNTEN$ , and  $CNTRST = V_{IH}$ .
28. During "No Operation", data in memory at the selected address may be corrupted and should be rewritten to ensure data integrity.

**Switching Waveforms (continued)**
**Flow-Through Read-to-Write-to-Read ( $\overline{OE} = V_{IL}$ )<sup>[17, 19, 27, 28]</sup>**

**Flow-Through Read-to-Write-to-Read (OE Controlled)<sup>[17, 19, 26, 27, 28]</sup>**

**Switching Waveforms (continued)**
**Pipelined Read with Address Counter Advance<sup>[29]</sup>**

**Flow-Through Read with Address Counter Advance<sup>[29]</sup>**

**Note:**

29.  $\overline{CE}_0$  and  $\overline{OE} = V_{IL}$ ;  $CE_1$ ,  $R/W$  and  $\overline{CNTRST} = V_{IH}$ .

### Switching Waveforms (continued)

Write with Address Counter Advance (Flow-Through or Pipelined Outputs)<sup>[30, 31]</sup>

**Notes:**

30.  $\overline{CE}_0, \overline{UB}, \overline{LB}$ , and  $R/W = V_{IL}$ ;  $CE_1$  and  $\overline{CNTRST} = V_{IH}$ .

31. The "Internal Address" is equal to the "External Address" when  $\overline{ADS} = V_{IL}$  and equals the counter output when  $\overline{ADS} = V_{IH}$ .

**Switching Waveforms (continued)**
**Counter Reset (Pipelined Outputs)**<sup>[19, 26, 32, 33]</sup>

**Notes:**

32.  $\overline{CE}_0$ ,  $\overline{UB}$ , and  $\overline{LB} = V_{IL}$ ;  $CE_1 = V_{IH}$ .
33. No dead cycle exists during counter reset. A READ or WRITE cycle may be coincidental with the counter reset.

**ReadWrite and Enable Operation**<sup>[34, 35, 36]</sup>

Inputs					Outputs	Operation
$\overline{OE}$	CLK	$\overline{CE}_0$	$\overline{CE}_1$	R/W	$I/O_0-I/O_{17}$	
X	—	H	X	X	High-Z	Deselected <sup>[37]</sup>
X	—	X	L	X	High-Z	Deselected <sup>[37]</sup>
X	—	L	H	L	$D_{IN}$	Write
L	—	L	H	H	$D_{OUT}$	Read <sup>[35]</sup>
H	X	L	H	X	High-Z	Outputs Disabled

**Address Counter Control Operation**<sup>[34, 38, 39, 40]</sup>

Address	Previous Address	CLK	$\overline{ADS}$	$\overline{CNTEN}$	$\overline{CNTRST}$	I/O	Mode	Operation
X	X	—	X	X	L	$D_{out(0)}$	Reset	Counter Reset to Address 0
$A_n$	X	—	L	X	H	$D_{out(n)}$	Load	Address Load into Counter
X	$A_n$	—	H	H	H	$D_{out(n)}$	Hold	External Address Blocked—Counter Disabled
X	$A_n$	—	H	L	H	$D_{out(n+1)}$	Increment	Counter Enabled—Internal Address Generation

**Notes:**

34. "X" = "Don't Care", "H" =  $V_{IH}$ , "L" =  $V_{IL}$ .  
 35.  $\overline{ADS}$ ,  $\overline{CNTEN}$ ,  $\overline{CNTRST}$  = "Don't Care".  
 36. OE is an asynchronous input signal.  
 37. When CE changes state in the pipelined mode, deselection and read happen in the following clock cycle.  
 38.  $\overline{CE}_0$  and OE =  $V_{IL}$ ;  $\overline{CE}_1$  and R/W =  $V_{IH}$ .  
 39. Data shown for flow-through mode; pipelined mode output will be delayed by one cycle.  
 40. Counter operation is independent of  $\overline{CE}_0$  and  $\overline{CE}_1$ .
