

131072-Word × 8-Bit High Speed CMOS Static RAM

Description

The Hitachi HM62V8128 is a CMOS static RAM organized 128 kword × 8 bit. It realizes higher density, higher performance and low power consumption by employing 0.8 μm Hi-CMOS process technology.

It offers low power standby power dissipation; therefore, it is suitable for battery back-up systems. The device, packaged in a 525-mil SOP (460-mil body SOP) or a 600-mil plastic DIP, or a 8 × 20 mm TSOP with thickness of 1.2 mm, is available for high density mounting. TSOP package is suitable for cards, and reverse type TSOP is also provided.

Features

- High Speed
Fast access time: 120/150 ns (max)
- Low power
Active: 18 mW (typ)
Standby: 3 μW (typ) (L-/L-L/L-SL version)
- Single 3 V supply
- Completely static memory
No clock or timing strobe required
- Equal access and cycle times
- Common data input and output
Three state output
- All inputs and outputs CMOS compatible.
- Capability of battery back up operation (L-/L-L/L-SL version)
2 chip selection for battery back up

Read Timing Waveform *4

- Notes:
1. t_{HZ} and t_{OHZ} are defined as the time at which the outputs achieve the open circuit conditions and are not referred to output voltage levels.
 2. At any given temperature and voltage condition, t_{HZ} max is less than t_{LZ} min both for a given device and from device to device.
 3. This parameter is sampled and not 100% tested.
 4. \overline{WE} is high for read cycle.

Write Timing Waveform (1) (OE Clock)

HM62V8128 Series

Write Timing Waveform (2) (\overline{OE} Low Fixed)

- Notes:
1. A write occurs during the overlap of a low $\overline{CS1}$, a high $CS2$, and a low \overline{WE} . A write begins at the latest transition among $\overline{CS1}$ going low, $CS2$ going high, and \overline{WE} going low. A write ends at the earliest transition among $\overline{CS1}$ going high, $CS2$ going low, and \overline{WE} going high. t_{wp} is measured from the beginning of write to the end of write.
 2. t_{cw} is measured from the later of $\overline{CS1}$ going low or $CS2$ going high to the end of write.
 3. t_{as} is measured from the address valid to the beginning of write.
 4. t_{wr} is measured from the earliest of $\overline{CS1}$ or \overline{WE} going high or $CS2$ going low to the end of write cycle.
 5. During this period, I/O pins are in the output state; therefore, the input signals of the opposite phase to the outputs must not be applied.
 6. If $\overline{CS1}$ goes low simultaneously with \overline{WE} going low or after \overline{WE} going low, the outputs remain in a high impedance state.
 7. D_{out} is the same phase of the latest written data in this write cycle.
 8. D_{out} is the read data of next address.
 9. If $\overline{CS1}$ is low and $CS2$ high during this period, I/O pins are in the output state. Therefore, the input signals of the opposite phase to the outputs must not be applied to them.
 10. This parameter is sampled and not 100% tested.
 11. This value is measured from $CS2$ going low to the end of write cycle.

Low V_{CC} Data Retention Characteristics ($T_a = 0$ to $+70^\circ\text{C}$)

This characteristics is guaranteed only for L-, L-L, and L-SL version.

Parameter	Symbol	Min	Typ	Max	Unit	Test conditions	Notes
V_{CC} for data retention	V_{DR}	2.0	—	—	V	$\overline{CS1} \geq V_{CC} - 0.2\text{ V}$, $CS2 \geq V_{CC} - 0.2\text{ V}$ or $0\text{ V} \leq CS2 \leq 0.2\text{ V}$ $V_{in} \geq 0\text{ V}$

Operation recovery time	t_R	5	—	—	ms		

Low V_{CC} Data Retention Timing Waveform (1) ($\overline{CS1}$ Controlled)

Low V_{CC} Data Retention Timing Waveform (2) ($CS2$ Controlled)

- Notes:
1. $20\ \mu\text{A}$ max at $T_a = 0$ to 40°C (Lversion).
 2. $6\ \mu\text{A}$ max at $T_a = 0$ to 40°C (L-Lversion).
 3. $3\ \mu\text{A}$ max at $T_a = 0$ to 40°C (L-SLversion).
 4. $CS2$ controls address buffer, \overline{WE} buffer, $\overline{CS1}$ buffer, \overline{OE} buffer, and D_{in} buffer. If $CS2$ controls data retention mode, V_{in} levels (address, \overline{WE} , \overline{OE} , $\overline{CS1}$, I/O) can be in the high impedance state. If $\overline{CS1}$ controls data retention mode, $CS2$ must be $CS2 \geq V_{CC} - 0.2\text{ V}$ or $0\text{ V} \leq CS2 \leq 0.2\text{ V}$. The other input levels (address, \overline{WE} , \overline{OE} , I/O) can be in the high impedance state.
