DESCRIPTION:

This octal transceiver is built using advanced dual metal CMOS technology. This high-speed, low power transceiver is ideal for asynchronous communication between two busses (A and B). The control function implementation allows maximum flexibility in timing. This device allows data transmission from the A bus to the B bus, or from the B bus to the A bus, depending upon the levels at the enable inputs (OEAB, $\overline{OEBA}$). The enable inputs can be used to disable the device so that the buses are effectively isolated. The capability to store data by simultaneous enabling of OEAB and $\overline{OEBA}$. Each output reinforces its input in this transceiver configuration. Thus, when both control inputs are enabled and all other data sources to the two sets of the bus lines are at high impedance OFF-state, both sets of bus lines will remain at their last states. The 8-bit codes appearing on the two sets of buses will be identical.

The LVC623A has been designed with a $\pm 24mA$ output driver. This driver is capable of driving a moderate to heavy load while maintaining speed performance.

All pins can be driven from either 3.3V or 5V devices. This feature allows the use of this device as a translator in a mixed 3.3V/5V supply system.
