

CY7C132/CY7C136 CY7C142/CY7C146

2Kx8 Dual-Port Static RAM

Features

- True Dual-Ported memory cells which allow simultaneous reads of the same memory location
- 2K x 8 organization
- 0.65-micron CMOS for optimum speed/power
- High-speed access: 15 ns
- Low operating power: $I_{CC} = 90$ mA (max.)
- Fully asynchronous operation
- Automatic power-down
- Master CY7C132/CY7C136 easily expands data bus width to 16 or more bits using slave CY7C142/CY7C146
- **BUSY** output flag on CY7C132/CY7C136; **BUSY** input on CY7C142/CY7C146
- **INT** flag for port-to-port communication (52-pin PLCC/PQFP versions)
- Available in 48-pin DIP (CY7C132/142), 52-pin PLCC and 52-pin TQFP (CY7C136/146)
- Pin-compatible and functionally equivalent to IDT7132/IDT7142

Functional Description

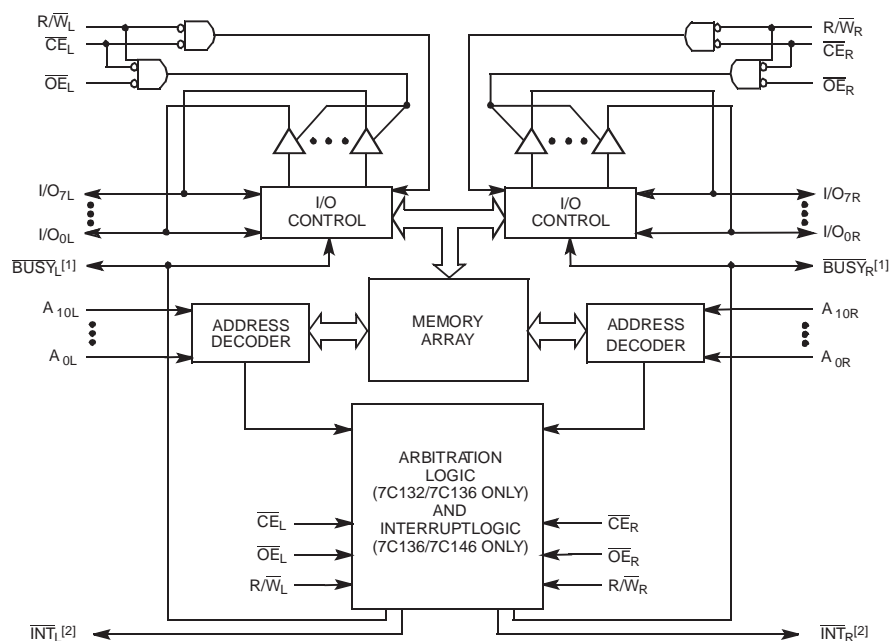

The CY7C132/CY7C136/CY7C142 and CY7C146 are high-speed CMOS 2K by 8 dual-port static RAMs. Two ports are provided to permit independent access to any location in memory. The CY7C132/ CY7C136 can be utilized as either a standalone 8-bit dual-port static RAM or as a MASTER dual-port RAM in conjunction with the CY7C142/CY7C146 SLAVE dual-port device in systems requiring 16-bit or greater word widths. It is the solution to applications requiring shared or buffered data such as cache memory for DSP, bit-slice, or multiprocessor designs.

Each port has independent control pins; chip enable (\overline{CE}), write enable (R/\overline{W}), and output enable (\overline{OE}). **BUSY** flags are provided on each port. In addition, an interrupt flag (**INT**) is provided on each port of the 52-pin PLCC version. **BUSY** signals that the port is trying to access the same location currently being accessed by the other port. On the PLCC version, **INT** is an interrupt flag indicating that data has been placed in a unique location (7FF for the left port and 7FE for the right port).

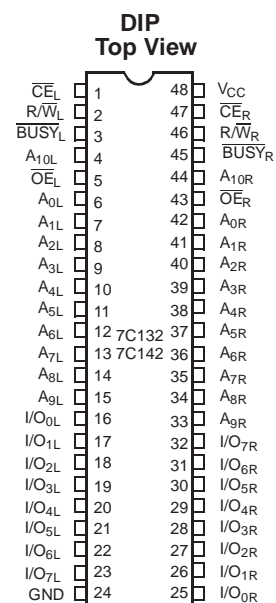

An automatic power-down feature is controlled independently on each port by the chip enable (\overline{CE}) pins.

The CY7C132/CY7C142 are available in 48-pin DIP. The CY7C136/CY7C146 are available in 52-pin PLCC and PQFP.

Pin Configuration

Notes:

1. CY7C132/CY7C136 (Master): **BUSY** is open drain output and requires pull-up resistor.
2. CY7C142/CY7C146 (Slave): **BUSY** is input.
3. Open drain outputs; pull-up resistor required.

Notes:

- Test conditions assume signal transition times of 5 ns or less, timing reference levels of 1.5V, input pulse levels of 0 to 3.0V and output loading of the specified I_{OL}/I_{OH} and 30-pF load capacitance.
- AC test conditions use $V_{OH} = 1.6V$ and $V_{OL} = 1.4V$.
- At any given temperature and voltage condition for any given device, t_{HZCE} is less than t_{LZCE} and t_{HZOE} is less than t_{LZOE} .
- t_{LZCE} , t_{LZWE} , t_{LZOE} , t_{LZWE} , t_{HZCE} , and t_{HZWE} are tested with $C_L = 5pF$ as in part (b) of AC Test Loads. Transition is measured ± 500 mV from steady-state voltage.
- The internal write time of the memory is defined by the overlap of \overline{CE} LOW and R/\overline{W} LOW. Both signals must be LOW to initiate a write and either signal can terminate a write by going HIGH. The data input setup and hold timing should be referenced to the rising edge of the signal that terminates the write.
- These parameters are measured from the input signal changing, until the output pin goes to a high-impedance state.
- CY7C142/CY7C146 only.
- A write operation on Port A, where Port A has priority, leaves the data on Port B's outputs undisturbed until one access time after one of the following:
 \overline{BUSY} on Port B goes HIGH.
Port B's address toggled.
 \overline{CE} for Port B is toggled.
 R/\overline{W} for Port B is toggled during valid read.
- 52-pin PLCC and PQFP versions only.

20. R/ \overline{W} is HIGH for read cycle.
21. Device is continuously selected, $\overline{CE} = V_{IL}$ and $\overline{OE} = V_{IL}$.
22. Address valid prior to or coincident with \overline{CE} transition LOW.

Write Cycle No. 2 (R/W Three-States Data I/Os-Either Port)^[15, 24]

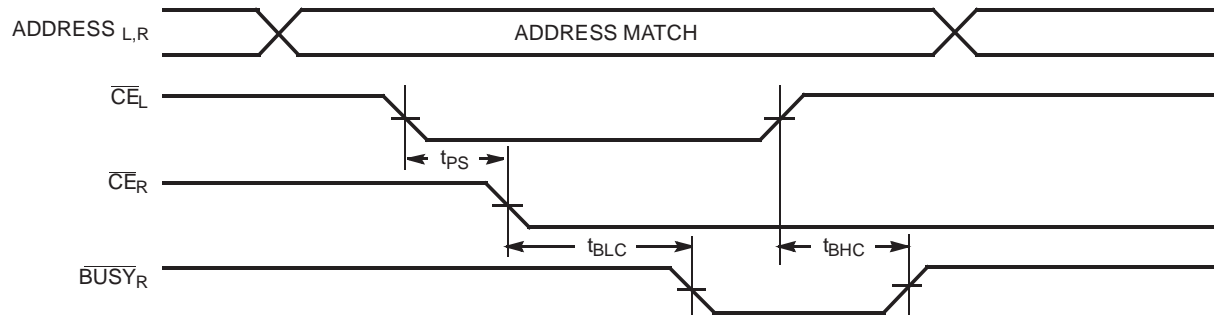

Notes:

23. If \overline{OE} is LOW during a R/W controlled write cycle, the write pulse width must be the larger of t_{PWE} or $t_{HZWE} + t_{SD}$ to allow the data I/O pins to enter high impedance and for data to be placed on the bus for the required t_{SD} .
24. If the \overline{CE} LOW transition occurs simultaneously with or after the R/W LOW transition, the outputs remain in a high-impedance state.
