

- Advanced, Catalog Speech Processor for High-Quality Sound, Capable of Unlimited Speech Duration Using External Memory
- Operates up to 12.32 MIPS
- Supports High-Quality Algorithms Such as MELP (1.0 Kbps – 3.5 Kbps at 8 kHz), CELP (3.0 Kbps – 11.2 kHz at 8 kHz Sampling Rate), ADPCM, Single Channel FM With CELP or MELP
- Speed and Pitch Shifting in MELP for Various Voice Effects
- Six Level Digital Gain Control
- 4 User Configurable I/O's
- Very Low-Power Operation, Ideal for Hand-Held Devices
- Low-Voltage Operation, Sustainable by Three (3) Batteries
- Three Reduced Power Standby Modes, Less Than 10 μ A in Deep-Sleep Mode
- Resistor-Trimmed Oscillator or 32.768-kHz Crystal Reference Oscillator
- Direct Speaker Drive (32 Ω) (PDM)
- Interrupt Driven, 4- or 8-Bit Parallel Data Transfer Protocol
- Available in Die Form or 64-Pin PM Package

description

The MSP53C691 is a standard slave synthesizer from Texas Instruments that accepts compressed speech data from other microprocessors/microcontrollers and converts it to speech. This allows the TI MSP53C691 to be used with a master microprocessor/microcontroller in various speech-related products such as security systems, learning aids, games, and toys. High quality, low bit-rate coders, easy interface with the master microcontroller, digital gain control, low power sleep mode, and low voltage operation makes this device ideal for products requiring long duration speech, less development cycle times, and peripheral device control through the slave device.

This device supports several speech synthesis algorithms that permit tradeoffs to meet the price performance requirements of various markets. The MSP53C691 implements a unique feature of playing a single channel FM music along with CELP or MELP speech data concurrently. This feature allows the user to speak a certain phrase in MELP or CELP with single channel music in the background.

The MSP53C691 is optimized to support a 4-bit wide data transfer protocol. The device has two status bits and three control bits that control the communication protocol between the master and the slave. The MSP53C691 also has 1 bit (command/data) which differentiates between a command or speech data feeding into the slave. In 4-bit mode, various commands are sent to the slave during speech to perform various tasks.

The MSP53C691 also supports the 8-bit wide data transfer but the support for commands is disabled during speaking-a-phrase. When speaking-a-phrase in 8-bit mode is complete, the MSP53C691 switches back to the 4-bit mode to receive the next command. Switching between 4-bit mode or 8 bit mode is permitted between speech data files.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

Terminal Functions

NAME	PIN NO.	PAD NO.	I/O	DESCRIPTION
DATA0–DATA3	39–36	25–22	I/O	Data bits 0 through 3 (in 4-bit or 8-bit mode)
DATA4 or DATA/COMMAND	35	21	I/O	Data bit 4 (in 8-bit mode) Data/command control bit (in 4-bit mode). Low signal indicates command and high signal indicates data.
DATA5–DATA7	34–32	20–18	I/O	Data bits 5 through 7 (8-bit mode only) Not used (4-bit mode only)
INRDY	6	6	O	An output signal from the slave to the microcontroller. A low signal indicates that the MSP53C691 is ready to accept data or command. A high signal indicates that the MSP53C691 is busy and the microcontroller must not write any data or command to it.
OUTRDY	5	5	O	An output signal from the slave to the microcontroller. A low signal indicates that the MSP53C691 is ready to send data or command to the microcontroller.
PD4–PD7	43–40	29–26	I/O	General-purpose I/O bus
R/W	3	3	I	An input signal to the slave from the microcontroller. Read/write select signal which is set high for read operations or set low for write operations by the microcontroller.
STROBE	4	4	I	An input signal to the slave from the microcontroller. STROBE sequences read or write operations in conjunction with the R/W signal. This signal is pulsed high-low-high for read or write operations sequencing.
Reference Oscillator Signals				
OSCOUT	15	15	O	Output of resistor/crystal oscillator
OSCIN	14	14	I	Input to resistor/crystal oscillator
PLL	13	13	O	Output of phase-lock-loop filter
Scan Port Control Signals				
SCANIN†	11	39	I	Scan port data input
SCANOUT†	8	35	O	Scan port data output
SCANCLK†	10	38	I	Scan port clock
SYNC†	9	37	I	Scan port synchronization
TEST†	7	36	I	C604: test modes
Digital-to-Analog Sound Output				
DACP	47	33	O	Digital-to-analog plus output (+)
DACM	45	31	O	Digital-to-analog minus output(–)
Initialization				
RESET	12	12	I	Device initialization
Power Signals‡				
VDD	1, 2, 31, 44, 46‡	1, 2, 17, 30, 32‡	—	Processor power, 5 V nominal supply voltage
VSS	16, 48, 49‡, 64	16, 34‡, 35, 36	—	Ground pin

† All pins must be N.C.

‡ Marked pins are VDD and VSS connections which service the DAC circuitry. These pins tend to sustain a higher current draw. A dedicated decoupling capacitor across these pins is therefore required.

read operation by the master

The process for the read operation by the master is the same in either 4-bit or 8-bit mode. The read operation by the master happens when the slave wants to send something to the master. The read process is initiated by the slave by pulling OUTRDY low when it is ready.

The following events take place during the read operation:

- The MSP53C691 puts the data to be sent to the master on the internal bus.
- The MSP53C691 sets OUTRDY low to indicate that it is ready to send data to the microcontroller.
- The microcontroller sets R/W high to indicate a read operation.
- The microcontroller sets STROBE low. The data is available on the external data-bus at this point.
- The microcontroller reads the data from the bus.
- The microcontroller sets STROBE high. The MSP53C691 also pulls OUTRDY high at the rising edge of STROBE.
- The data is taken from the external data-bus after STROBE goes high.

The microcontroller should latch or read in the data while STROBE is low. When the microcontroller sets STROBE high, the MSP53C691 sets OUTRDY high to indicate that the data has been successfully transferred.

Figure 3 shows the sequence of events of the read operation.

read operation by the master (continued)

b) Read—Two speech data transfer sequences:

Figure 3. Data Transfer – Read

write operation by the master

The process for the write operation by the master is the same in either 4-bit or 8-bit mode. The write operation by the master happens when the slave is ready to request data or command from the master. The write process is initiated by the slave by pulling $\overline{\text{INRDY}}$ low when the slave is ready to receive data.

The following events take place during the write operation:

- The MSP53C691 sets $\overline{\text{INRDY}}$ low to indicate that it is ready to receive data from the microcontroller.
- The microcontroller sets $\overline{\text{R/W}}$ low to indicate a write operation.
- The microcontroller puts the data in the external data-bus.
- The microcontroller sets $\overline{\text{STROBE}}$ low after the data is valid.
- The microcontroller sets $\overline{\text{STROBE}}$ high after a minimum of 300 ns. The MSP53C691 also pulls $\overline{\text{INRDY}}$ high at the rising edge of $\overline{\text{STROBE}}$.
- The data is latched in the MSP53C691 at the rising edge of $\overline{\text{STROBE}}$.

SPSS030A – DECEMBER 2000 – REVISED FEBRUARY 2001

write operation by the master (continued)

When the microcontroller sets $\overline{\text{STROBE}}$ high, the MSP53C691 sets $\overline{\text{INRDY}}$ high to indicate that the MSP53C691 is not ready to receive any more data.

absolute maximum ratings over operating free-air temperature range (unless otherwise noted)[†]

Supply voltage, V_{DD} (see Note 1)	–0.3 V to 7 V
Supply current, I_{DD} (see Note 2)	35 mA
Input voltage range, V_I (see Note 1)	–0.3 V to $V_{DD} + 0.3$ V
Output voltage range, V_O (see Note 1)	–0.3 V to $V_{DD} + 0.3$ V
Storage temperature range, T_A	–30°C to 125°C

[†] Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTES: 1. Unless otherwise noted, all voltages are measured with respect to V_{SS} .
2. The total supply current includes the current out of all the I/O pins as well as the operating current of the device.

recommended operating conditions

	MIN	MAX	UNIT
Supply voltage, V_{DD} (with respect to V_{SS})	3	5.2	V
CPU clock rate, f_{CPU} (as programmed)	64	12,320	kHz
Load resistance between DACP and DACM, $R_{(DAC)}$	32		Ω
Operating free-air temperature, T_A	0	70	°C

timing requirements
