QUAD, LOW-POWER VIDEO BUFFER
General Description

The CLC114 is a high-performance, closed-loop quad buffer intended for power sensitive applications. Requiring only 30mW of quiescent power dissipation per channel ($\pm 5V$ supplies), the CLC114 offers a small signal bandwidth of 200MHz (0.5Vpp) and a slew rate of 450V/uS.

Designed specifically for high density crosspoint switch and analog multiplexer applications, the CLC114 offers excellent linearity and wide channel isolation (62dB @ 10MHz). Driving a typical crosspoint switch load, the CLC114 offers differential gain and phase performance of 0.08% and 0.1%; gain flatness through 30MHz is typically 0.1dB.

With its patented closed-loop topology, the CLC114 has significant performance advantages over conventional open-loop designs. Applications requiring low output impedance and true unity gain stability through very high frequencies (active filters, dynamic load buffering, etc.) will benefit from the CLC114's superior performance.

Features

- Closed-loop, quad buffer
- 200MHz small-signal bandwidth
- 450V/ μ S slew rate
- Low power, 30mW per channel (± 5 V sup.)
- 62dB channel isolation (10MHz)
- Specified for crosspoint switch loads

Applications

- Video crosspoint switch driver
- Video distribution buffers
- Video switching buffers
- Video signaling multiplexing
- Instrumentation amps
- Active filters

Note 1: Absolute Maximum Ratings are limits beyond which damage to the device may occur. Operating Ratings are conditions for which the device is functional, but do not guarantee specific performance limits. For guaranteed specifications and test conditions see the Electrical Characteristics. The guaranteed specifications apply only for the test conditions listed. Some performance characteristics may degrade when the device is not operated under the listed test conditions.

Note 2: The maximum power dissipation must be derated at elevated temperatures and is dictated by Tjmax (maximum junction temperature), ThetaJA (package junction to ambient thermal resistance), and TA (ambient temperature). The maximum allowable power dissipation at any temperature is $P_{dmax} = (T_{jmax} - T_A) / \Theta_{JA}$ or the number given in the Absolute Maximum Ratings, whichever is lower.

Note 3: Human body model, 100pF discharged through 1.5K Ohms.

Note 1: If not tested, shall be guaranteed to the limits specified in table I herein.

Note 2: Three channels are driven simultaneously while observing the output of the undriven fourth channel.

Note 3: Group A sample tested only.

Note 4: The algebraic convention, whereby the most negative value is a minimum and most positive is a maximum, is used in this table. Negative current shall be defined as conventional current flow out of a device terminal.
