FEATURES:

* Low Collector-Emitter Saturation Voltage -

$$V_{CE(SAT)} = 2.0V(\text{Max.}) @ I_C = 4.0A$$

$$= 3.0V(\text{Max.}) @ I_C = 8.0A$$

* Monolithic Construction With Built-In Base-Emitter Shunt Resistors

ACTIVE-REGION SAFE OPERATING AREA (SOA)

There are two limitations on the power handling ability of a transistor: average junction temperature and second breakdown. Safe operating area curves indicate I_c-V_{CE} limits of the transistor that must be observed for reliable operation, i.e., the transistor must not be subjected to greater dissipation than curves indicate.

The data of SOA curve is based on T_{J(PK)}=200°C; T_c is variable depending on conditions. Second breakdown pulse limits are valid for duty cycles to 10% provided T_{J(PK)} ≤ 200°C. At high case temperatures, thermal limitation will reduce the power that can be handled to values less than the limitations imposed by second breakdown.
