

# Read/Write Crypto Transponder for Short Cycle Time

#### **Description**

The TK5561A-PP is a complete transponder integrating all important functions for immobilizer and identification systems. It consists of a plastic cube which accommodates the crypto IDIC®\*) e5561A and the antenna realized as tuned LC-circuit. The TK5561A-PP is a R/W crypto transponder for applications which demand higher security levels than those which standard R/W transponders can fulfil. For this reason, the TK5561A-PP has an additional encryption algorithm block which enables a base station to authenticate the transponder. Any attempt

to fake the base station with a wrong transponder will be recognized immediately. For authentication, the base station transmits a challenge to the TK5561A-PP. This challenge is encrypted by both IC and base station. Both should possess the same secret key. Only then the result be expected to be equal.

For detailed technical information about functions, configurations etc., please refer to the e5561 data sheet.

#### **Features**

- 65 ms cycle time for crypto algorithm programmable
- Encryption time < 10 ms, < 30 ms optional
- Identification transponder in plastic cube
- Contactless read/write data transmission
- High-security crypto algorithm optional
- Inductive coupled power supply at 125 kHz
- Basic component R/W e5561 IDIC
- Built-in coil and capacitor for circuit antenna
- Starts with cyclical data read out
- Self-adapting resonance frequency (optionally)

- 128-bit user-programmable EEPROM
- Typical < 50 ms to write and verify a block
- Read/write protection by lock bits
- Options set by EEPROM

Bitrate [bit/s]: Rf/32; Rf/64

Modulaton: Manchester; Biphase

### **Application**

- Car immobilizers with higher security level
- High-security identification systems

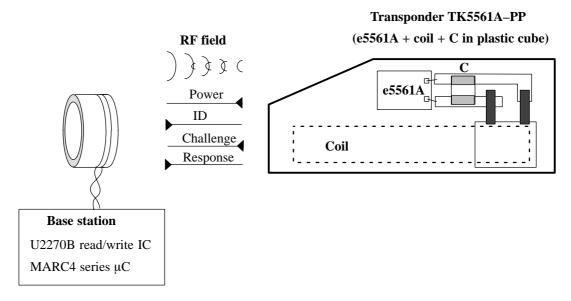

Figure 1. Transponder and base station

\*) IDIC® stands for **ID**entification Integrated Circuit and is a trademark of TEMIC Semiconductors.

Rev.A1, 02-Dec-99

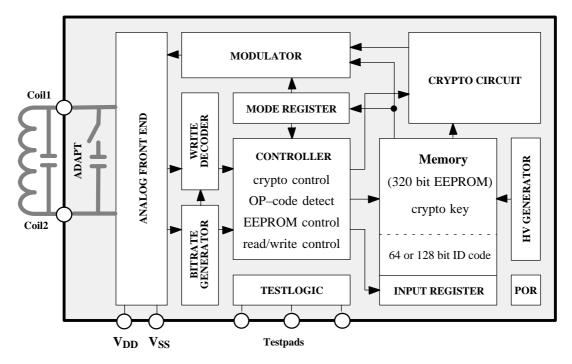

Figure 2. Block diagram

#### General

The transponder is the mobile part of the closed coupled identification system (see figure 1), whereas the read/ write base station is basing on the U2270B or on discrete solutions, and the read/write transponder is basing on the e5561A  $\overline{IDIC}^{\$}$ .

The transponder is a plastic-cube device consisting of following parts:

- The transponder antenna, realized as tuned LC-circuit
- Read/write IDIC® (e5561A) with EEPROM

#### The Transponder Antenna

The antenna consists of a coil and a capacitor for tuning the circuit to the nominal carrier frequency of 125 kHz. The coil has a ferrite core for improving the distance of read, write and programming operations.

### **Read-Write Crypto Identification**

The e5561A is a member of the TEMIC contactless **ID**entification **IC** (IDIC)<sup>®</sup> family, which are used in applications where information has to be transmitted without contacts. The IDIC<sup>®</sup> is connected to a tuned LC

circuit for power supply and bidirectional data communication (Read/Write) to a base station.

The on-chip non-volatile memory of the 320-bit EEPROM (10 blocks 32 bits each) can be read and written blockwise by a read/write base station, e.g. basing on the U2270B. Up to four blocks consists of the ID code user programmable, the crypto key and configurations are stored in six blocks. The crypto key and the ID code can be individually protected against overwriting.

The typical operational frequency of the TK5561A-PP is 125 kHz. Two data bit rates are programmable: Rf/32 and Rf/64. During the reading operation the incoming RF field is damped bit-wise by an on-chip load. This AM-modulation is detected by the field generating base station unit. Data transmission starts after power-up with the transmission of the ID code and continues as long as the TK5561A-PP is powered.

Writing is carried out by means of TEMIC Semiconductors writing method (patented). To transmit data to the TK5561A-PP the read/ write base station has to interrupt the RF field for a short time to create a field gap. The information is encoded in the number of clock cycles between two subsequent gaps.

See e5561A data sheet for detailed information of IDIC<sup>®</sup>.

### **Electrical Characteristics**

### **Absolute Maximum Ratings**

Parameters	Symbol	Value	Unit
Operating temperature range	T <sub>amb</sub>	-40 to +85	°C
Storage temperature range	T <sub>stg</sub>	-40 to +125	°C
Maximum assembly temperature, $t < 5$ min.	$T_{ass}$	170	°C
Magnetic field strength at 125 kHz	H <sub>pp</sub>	1000	A/m

## **Operating Characteristics Transponder**

 $T_{amb} = 25$ °C, f = 125 kHz if not otherwise noted

Parameters	Test Conditions / Pins	Symbol	Min.	Typ.	Max.	Unit	
Inductance		L		4.2		mH	
LC circuit, $H_{PP} = 20 \text{ A/m}$							
Resonance frequency	Tamb = $-40$ to $+85$ °C	f <sub>r</sub>	121	125	129	kHz	
Quality factor		QLC	5	8	11		

#### Magnetic field strength (H)

Parameters	Test Conditions / Pins	Symbol	Min.	Typ.	Max.	Unit
Max. field strength where transponder does not modulate	No influence to other transponders in the field	H <sub>pp not</sub>		5		A/m
Minimum field strength						
Read mode	$T_{amb} = -40$ °C	H <sub>pp -40</sub>			24	A/m
	$T_{amb} = 25^{\circ}C$	H <sub>pp 25</sub>			18	A/m
	$T_{amb} = 85^{\circ}C$	H <sub>pp 85</sub>			15	A/m
Programming mode	$T_{amb} = -40^{\circ}C$	H <sub>ppp</sub> –40			30	A/m
	$T_{amb} = 25^{\circ}C$	H <sub>ppp 25</sub>			35	A/m
	$T_{amb} = 85^{\circ}C$	H <sub>ppp 85</sub>			40	A/m
Lowest adapt frequency		$f_{LA}$	118	121	124.5	kHz
Highest adapt frequency		f <sub>HA</sub>	125	128	131.5	kHz
Data retention EEPROM	$T = 25^{\circ}C$	t <sub>retention</sub>	10			Years
Programming cycles EEPROM			100,000			
Programming time / block	RF = 125  kHz	t <sub>p</sub>		16		ms
Maximum field strength		H <sub>pp max</sub>			600	A/m

Rev.A1, 02-Dec-99 3 (8)

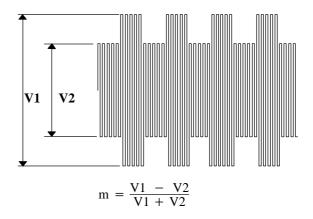

Figure 3. Typical curve for degree of modulation

Figure 4. Measurement of the degree of modulation

### **Measurement Assembly**

All parameters are measured in a Helmholtz-arrangement which generates a homogenous magnetic field (see figure 5 and 6). A function generator drives the field generating coils, so the magnetic field can be varied in frequency and field strength.

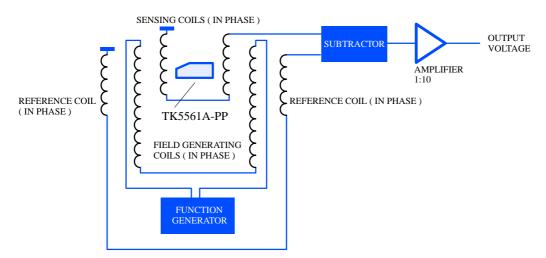

Figure 5. Testing application

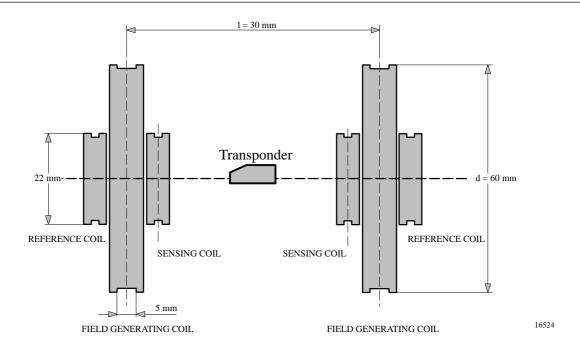

Figure 6. Testing geometry

#### Writing Data into the TK5561A-PP

A write sequence of the TK5561A-PP is shown below. Writing data into the transponder occurs by interrupting the RF field with short gaps. After the start gap the write op-code (10) is transmitted. The next 32 bits contain the

actual data. The last 4 bits denote the destination block address. If the correct number of bits have been received, the actual data is programmed into the specified memory block.

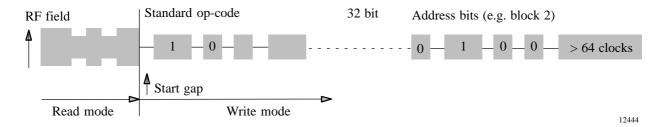

Figure 7. Write protocol to program the EEPROM

#### Write Data Decoding

The time elapsing between two detected gaps is used to encode the information. As soon as a gap is detected, a counter starts counting the number of field clock cycles until the next gap will be detected. Depending on how many field clocks elapse, the data is regarded as '0' or '1'. The required number of field clocks is shown in figure 8.

A valid '0' is assumed if the number of counted clock periods is between 16 and 32, for a valid '1' it is 48 or 64 respectively. Any other value being detected results in an error and the device exits write mode and returns to read mode.

Rev.A1, 02-Dec-99 5 (8)

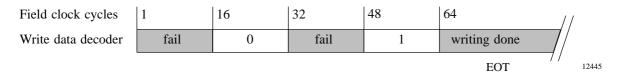

Figure 8. Write data decoding scheme

#### **Behavior of the Real Device**

The TK5561A-PP detects a gap if the voltage across the coils decreases below a peak-to-peak value of about 800 mV. Until then, the clock pulses are counted. The number given for a valid '0' or '1' (see figure 8), refer to the actual clock pulses counted by the device. However, there are always more clock pulses being counted than where applied by the base station. The reason for this is the fact, that a RF field cannot be switched off immediately. The coil voltage decreases exponentially. So although the RF field coming from the base station is switched off, it takes some time until the voltage across the coils reaches the threshold peak-to-peak value of about 800 mV and the device detects the gap.

Referring to the following diagram (figure 9) this means that the device uses the times  $t_{0 \text{ internal}}$  and  $t_{1 \text{ internal}}$ . The exact times for  $t_{0}$  and  $t_{1}$  are dependent on the application (e.g., field strength, etc.)

Typical time frames are:

$$t_0 = 60 \text{ to } 140 \text{ }\mu\text{s}$$
  
 $t_1 = 300 \text{ to } 400 \text{ }\mu\text{s}$   
 $t_{gap} = 150 \text{ to } 400 \text{ }\mu\text{s}$ 

Antennas with a high Q-factor require longer times for  $t_{gap}$  and shorter time values for  $t_0$  and  $t_1$ .

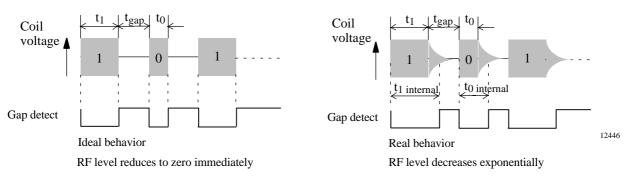

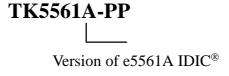

Figure 9. Ideal and real behavior signals

### **Operating Distance**

The maximum distance between the base-station and the TK5561A-PP depends mainly on the base-station, the coil geometries and the chosen modulation options. Typical distances are 0 to 3 cm. A general maximum distance value can not be given. A convenient way is to measure the TK5561A-PP within its environment. Rules for a correct base-station design can provided on request (see Antenna Design Guide).

#### **Ozone Depleting Substances Policy Statement**

It is the policy of **TEMIC Semiconductor GmbH** to

- 1. Meet all present and future national and international statutory requirements.
- Regularly and continuously improve the performance of our products, processes, distribution and operating systems with respect to their impact on the health and safety of our employees and the public, as well as their impact on the environment.

It is particular concern to control or eliminate releases of those substances into the atmosphere which are known as ozone depleting substances (ODSs).

The Montreal Protocol (1987) and its London Amendments (1990) intend to severely restrict the use of ODSs and forbid their use within the next ten years. Various national and international initiatives are pressing for an earlier ban on these substances.

**TEMIC Semiconductor GmbH** has been able to use its policy of continuous improvements to eliminate the use of ODSs listed in the following documents.

- 1. Annex A, B and list of transitional substances of the Montreal Protocol and the London Amendments respectively
- 2. Class I and II ozone depleting substances in the Clean Air Act Amendments of 1990 by the Environmental Protection Agency (EPA) in the USA
- 3. Council Decision 88/540/EEC and 91/690/EEC Annex A, B and C (transitional substances) respectively.

**TEMIC Semiconductor GmbH** can certify that our semiconductors are not manufactured with ozone depleting substances and do not contain such substances.

We reserve the right to make changes to improve technical design and may do so without further notice.

Parameters can vary in different applications. All operating parameters must be validated for each customer application by the customer. Should the buyer use TEMIC Semiconductors products for any unintended or unauthorized application, the buyer shall indemnify TEMIC Semiconductors against all claims, costs, damages, and expenses, arising out of, directly or indirectly, any claim of personal damage, injury or death associated with such unintended or unauthorized use.
