## NCP9004

### 2.65 W Filterless Class-D Audio Power Amplifier

The NCP9004 is a cost-effective mono Class-D audio power amplifier capable of delivering 2.65 W of continuous average power to $4.0 \Omega$ from a 5.0 V supply in a Bridge Tied Load (BTL) configuration. Under the same conditions, the output power stage can provide 1.4 W to a $8.0 \Omega$ BTL load with less than $1 \% \mathrm{THD}+\mathrm{N}$. For cellular handsets or PDAs it offers space and cost savings because no output filter is required when using inductive tranducers. With more than $90 \%$ efficiency and very low shutdown current, it increases the lifetime of your battery and drastically lowers the junction temperature.

The NCP9004 processes analog inputs with a pulse width modulation technique that lowers output noise and THD when compared to a conventional sigma-delta modulator. The device allows independent gain while summing signals from various audio sources. Thus, in cellular handsets, the earpiece, the loudspeaker and even the melody ringer can be driven with a single NCP9004. Due to its low $42 \mu \mathrm{~V}$ noise floor, A-weighted, a clean listening is guaranteed no matter the load sensitivity.

## Features

- Optimized PWM Output Stage: Filterless Capability
- Efficiency up to $90 \%$

Low 2.5 mA Typical Quiescent Current

- Large Output Power Capability: 1.4 W with $8.0 \Omega$ Load and THD $+\mathrm{N}<1 \%$
- Wide Supply Voltage Range: 2.5-5.5 V Operating Voltage
- High Performance, THD+N of $0.03 \% @ \mathrm{~V}_{\mathrm{p}}=5.0 \mathrm{~V}$,

$$
\mathrm{R}_{\mathrm{L}}=8.0 \Omega, \mathrm{P}_{\text {out }}=100 \mathrm{~mW}
$$

- Excellent PSRR (-65 dB): No Need for Voltage Regulation
- Surface Mounted Package 9-Pin Flip-Chip CSP (SnPb and Pb-Free)
- Fully Differential Design. Eliminates Two Input Coupling Capacitors
- Very Fast Turn On/Off Times with Advanced Rising and Falling Gain Technique
- External Gain Configuration Capability
- Internally Generated 250 kHz Switching Frequency
- Short Circuit Protection Circuitry
- "Pop and Click" Noise Protection Circuitry

## Applications

- Cellular Phone
- Portable Electronic Devices
- PDAs and Smart Phones
- Portable Computer

TYPICAL APPLICATION

Figure 1. Typical Application

## PIN DESCRIPTION

| Pin No. | Symbol | Type | Description |
| :---: | :---: | :---: | :--- |
| A1 | INP | I | Positive Differential Input. |
| A2 | GND | I | Analog Ground. |
| A3 | OUTM | O | Negative BTL Output. |
| B1 | $\mathrm{V}_{\mathrm{p}}$ | I | Power Analog Positive Supply. Range: $2.5 \mathrm{~V}-5.5 \mathrm{~V}$. |
| B2 | $\mathrm{V}_{\mathrm{p}}$ | I | Power Analog Positive Supply. Range: $2.5 \mathrm{~V}-5.5 \mathrm{~V}$. |
| B3 | GND | I | Analog Ground. |
| C1 | INM | I | Negative Differential Input. |
| C2 | SD | I | The device enters in Shutdown Mode when a low level is applied on this pin. An internal 300 $\mathrm{k} \Omega$ <br> resistor will force the device in shutdown mode if no signal is applied to this pin. It also helps to <br> save space and cost. |
| C3 | OUTP | O | Positive BTL Output. |

MAXIMUM RATINGS

| Symbol | Rating | Max | Unit |
| :---: | :---: | :---: | :---: |
| $\mathrm{V}_{\mathrm{p}}$ | Supply VoltageActive Mode <br> Shutdown Mode | $\begin{aligned} & 6.0 \\ & 7.0 \end{aligned}$ | V |
| $\mathrm{V}_{\text {in }}$ | Input Voltage | -0.3 to $\mathrm{V}_{\mathrm{CC}}+0.3$ | V |
| $\mathrm{I}_{\text {out }}$ | Max Output Current (Note 1) | 1.5 | A |
| $\mathrm{P}_{\mathrm{d}}$ | Power Dissipation (Note 2) | Internally Limited | - |
| $\mathrm{T}_{\text {A }}$ | Operating Ambient Temperature | -40 to +85 | ${ }^{\circ} \mathrm{C}$ |
| $\mathrm{T}_{J}$ | Max Junction Temperature | 150 | ${ }^{\circ} \mathrm{C}$ |
| $\mathrm{T}_{\text {stg }}$ | Storage Temperature Range | -65 to +150 | ${ }^{\circ} \mathrm{C}$ |
| $\mathrm{R}_{\text {өJA }}$ | Thermal Resistance Junction-to-Air | 90 (Note 3) | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
|  | ESD Protection <br> Human Body Model (HBM) (Note 4) <br> Machine Model (MM) (Note 5) | $\begin{gathered} >2000 \\ >200 \end{gathered}$ | V |
| - | Latchup Current @ $\mathrm{T}_{\mathrm{A}}=85^{\circ} \mathrm{C}$ (Note 6) | $\pm 70$ | mA |
| MSL | Moisture Sensitivity (Note 7) | Level 1 |  |

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

1. The device is protected by a current breaker structure. See "Current Breaker Circuit" in the Description Information section for more information.
2. The thermal shutdown is set to $160^{\circ} \mathrm{C}$ (typical) avoiding irreversible damage to the device due to power dissipation.
3. For the 9-Pin Flip-Chip CSP package, the $\mathrm{R}_{\theta \mathrm{JA}}$ is highly dependent of the PCB Heatsink area. For example, $\mathrm{R}_{\theta J \mathrm{~A}}$ can equal $195^{\circ} \mathrm{C} / \mathrm{W}$ with $50 \mathrm{~mm}^{2}$ total area and also $135^{\circ} \mathrm{C} / \mathrm{W}$ with $500 \mathrm{~mm}^{2}$. When using ground and power planes, the value is around $90^{\circ} \mathrm{C} / \mathrm{W}$, as specified in table.
4. Human Body Model: 100 pF discharged through a $1.5 \mathrm{k} \Omega$ resistor following specification JESD22/A114. B2 pin (Vp) qualified at 1500 V .
5. Machine Model: 200 pF discharged through all pins following specification JESD22/A115.
6. Latchup Testing per JEDEC Standard JESD78.
7. Moisture Sensitivity Level (MSL): 1 per IPC/JEDEC standard: J-STD-020A.

Figure 2. Test Setup for Graphs

## NOTES:

1. Unless otherwise noted, $\mathrm{C}_{\mathrm{i}}=100 \mathrm{nF}$ and $\mathrm{R}_{\mathrm{i}}=150 \mathrm{k} \Omega$. Thus, the gain setting is $2 \mathrm{~V} / \mathrm{V}$ and the cutoff frequency of the input high pass filter is set to 10 Hz . Input capacitors are shorted for CMRR measurements.
2. To closely reproduce a real application case, all measurements are performed using the following loads:
$\mathrm{R}_{\mathrm{L}}=8 \Omega$ means Load $=15 \mu \mathrm{H}+8 \Omega+15 \mu \mathrm{H}$
$\mathrm{R}_{\mathrm{L}}=4 \Omega$ means Load $=15 \mu \mathrm{H}+4 \Omega+15 \mu \mathrm{H}$
Very low DCR $15 \mu \mathrm{H}$ inductors ( $50 \mathrm{~m} \Omega$ ) have been used for the following graphs. Thus, the electrical load measurements are performed on the resistor ( $8 \Omega$ or $4 \Omega$ ) in differential mode.
3. For Efficiency measurements, the optional 30 kHz filter is used. An RC low-pass filter is selected with ( $100 \Omega, 47 \mathrm{nF}$ ) on each PWM output.

## DESCRIPTION INFORMATION

## Detailed Description

The basic structure of the NCP9004 is composed of one analog pre-amplifier, a pulse width modulator and an H -bridge CMOS power stage. The first stage is externally configurable with gain-setting resistor $\mathrm{R}_{\mathrm{i}}$ and the internal fixed feedback resistor $\mathrm{R}_{\mathrm{f}}$ (the closed-loop gain is fixed by the ratios of these resistors) and the other stage is fixed. The load is driven differentially through two output stages.

The differential PWM output signal is a digital image of the analog audio input signal. The human ear is a band pass filter regarding acoustic waveforms, the typical values of which are 20 Hz and 20 kHz . Thus, the user will hear only the amplified audio input signal within the frequency range. The switching frequency and its harmonics are fully filtered. The inductive parasitic element of the loudspeaker helps to guarantee a superior distortion value.

## Power Amplifier

The output PMOS and NMOS transistors of the amplifier have been designed to deliver the output power of the specifications without clipping. The channel resistance $\left(\mathrm{R}_{\text {on }}\right)$ of the NMOS and PMOS transistors is typically $0.3 \Omega$.

## Turn On and Turn Off Transitions

In order to eliminate "pop and click" noises during transition, the output power in the load must not be established or cutoff suddenly. When a logic high is applied to the shutdown pin, the internal biasing voltage rises quickly and, 4 ms later, once the output DC level is around the common mode voltage, the gain is established slowly
$(5.0 \mathrm{~ms})$. This method to turn on the device is optimized in terms of rejection of "pop and click" noises. Thus, the total turn on time to get full power to the load is 9 ms (typical) (see Figure 35).
The device has the same behavior when it is turned-off by a logic low on the shutdown pin. No power is delivered to the load 5 ms after a falling edge on the shutdown pin (see Figure 36). Due to the fast turn on and off times, the shutdown signal can be used as a mute signal as well.

## Shutdown Function

The device enters shutdown mode when the shutdown signal is low. During the shutdown mode, the DC quiescent current of the circuit does not exceed $1.5 \mu \mathrm{~A}$.

## Current Breaker Circuit

The maximum output power of the circuit corresponds to an average current in the load of 820 mA .
In order to limit the excessive power dissipation in the load if a short-circuit occurs, a current breaker cell shuts down the output stage. The current in the four output MOS transistors are real-time controlled, and if one current exceeds the threshold set to 1.5 A , the MOS transistor is opened and the current is reduced to zero. As soon as the short-circuit is removed, the circuit is able to deliver the expected output power.

This patented structure protects the NCP9004. Since it completely turns off the load, it minimizes the risk of the chip overheating which could occur if a soft current limiting circuit was used.

## APPLICATION INFORMATION

## NCP9004 PWM Modulation Scheme

The NCP9004 uses a PWM modulation scheme with each output switching from 0 to the supply voltage. If $\mathrm{V}_{\mathrm{in}}=0 \mathrm{~V}$ outputs OUTM and OUTP are in phase and no current is flowing through the differential load. When a positive signal
is applied, OUTP duty cycle is greater than $50 \%$ and OUTM is less than $50 \%$. With this configuration, the current through the load is 0 A most of the switching period and thus power losses in the load are lowered.

Figure 37. Output Voltage and Current Waveforms into an Inductive Loudspeaker DC Output Positive Voltage Configuration

## Voltage Gain

The first stage is an analog amplifier. The second stage is a comparator: the output of the first stage is compared with a periodic ramp signal. The output comparator gives a pulse width modulation signal (PWM). The third and last stage is the direct conversion of the PWM signal with MOS transistors H-bridge into a powerful output signal with low impedance capability.

The total gain of the device is typically set to:

$$
\frac{300 \mathrm{k} \Omega}{\mathrm{R}_{\mathrm{i}}}
$$

## Input Capacitor Selection ( $\mathrm{C}_{\text {in }}$ )

The input coupling capacitor blocks the DC voltage at the amplifier input terminal. This capacitor creates a high-pass filter with $R_{i n}$, the cut-off frequency is given by $F_{c}=\frac{1}{2 \times \pi \times R_{i} \times C_{i}}$.

When using an input resistor set to $150 \mathrm{k} \Omega$, the gain configuration is $2 \mathrm{~V} / \mathrm{V}$. In such a case, the input capacitor selection can be from 10 nF to $1 \mu \mathrm{~F}$ with cutoff frequency values between 1 Hz and 100 Hz . The NCP9004 also includes a built in low pass filtering function. It's cut off frequency is set to 20 kHz .

## Optional Output Filter

This filter is optional due to the capability of the speaker to filter by itself the high frequency signal. Nevertheless, the high frequency is not audible and filtered by the human ear.
An optional filter can be used for filtering high frequency signal before the speaker. In this case, the circuit consists of two inductors ( $15 \mu \mathrm{H}$ ) and two capacitors (2.2 $\mu \mathrm{F}$ ) (Figure 38). The size of the inductors is linked to the output power requested by the application. A simplified version of this filter requires a $1 \mu \mathrm{~F}$ capacitor in parallel with the load, instead of two $2.2 \mu \mathrm{~F}$ connected to ground (Figure 39).
Cellular phones and portable electronic devices are great applications for Filterless Class-D as the track length between the amplifier and the speaker is short, thus, there is usually no need for an EMI filter. However, to lower radiated emissions as much as possible when used in filterless mode, a ferrite filter can often be used. Select a ferrite bead with the high impedance around 100 MHz and a very low DCR value in the audio frequency range is the best choice. The MPZ1608S221A1 from TDK is a good choice. The package size is 0603 .

## PCB Layout Information

NCP9004 is suitable for low cost solution. In a very small package it gives all the advantages of a Class-D audio amplifier. Due to its fully differential capability, the audio signal can only be provided by an input resistor. If a low pass filtering function is required, then an input coupling capacitor is needed. The values of these components determine the voltage gain and the bandwidth frequency. The battery positive supply voltage requires a good decoupling capacitor versus the expected distortion.

When the board is using Ground and Power planes with at least 4 layers, a single $4.7 \mu \mathrm{~F}$ filtering ceramic capactior on the bottom face will give optimized performance.

A $1.0 \mu \mathrm{~F}$ low ESR ceramic capacitor can also be used with slightly degraded performances on the THD+N from $0.06 \%$ up to $0.2 \%$.

In two layer application, if both $V_{p}$ pins are connected on the top layer, two decoupling capacitors will improve the THD +N level. For example, a pair of capactors, 470 nF and $4.7 \mu \mathrm{~F}$, are good choices for filtering the power supply.
The NCP9004 power audio amplifier can operate from 2.5 V until 5.5 V power supply. With less than $2 \% \mathrm{THD}+\mathrm{N}$, it delivers 500 mW rms output power to a $8.0 \Omega$ load at $\mathrm{V}_{\mathrm{p}}=3.0 \mathrm{~V}$ and 1.0 W rms output power at $\mathrm{V}_{\mathrm{p}}=4.0 \mathrm{~V}$.

Figure 45. Top Layer
Note: This track between Vp pins is only needed when a 2 layers board is used. In case of a typical 4 or more layers, the use of laser vias in pad will optimize the THD+N floor.

## ORDERING INFORMATION

| Device | Marking | Package | Shipping $\dagger$ |
| :--- | :---: | :---: | :---: |
| NCP9004FCT1G | MAQ | 9-Pin Flip-Chip CSP <br> (Pb-Free) | 3000/Tape \& Reel |
|  |  |  |  |
